DETAILED TABLES—CONTINUED

Families—Continued	Page
16. Regions and divisions—families and unrelated individuals, by total money income in 1985, race, and Hispanic origin of householder	52
17. Type of family and age of householder—families, by total money income in 1985 and race of householder	56
18. Age and sex—all unrelated individuals and nonfamily householders 15 years and over, by total money income in 1985 and race	68
19. Size and type of family—families, by total money income in 1985, race, and Hispanic origin of householder	73
20. Number of related children under 18 years—families, by total money income in 1985 and type of family	77
21. Age of own children—families, by total money income in 1985 and type of family	78
22. Number of earners—families with civilian members, by total money income in 1985, race, and Hispanic origin of householder	79
23. Earnings of wife, by earnings of husband in 1985—married-couple families, by work experience in 1985	81
24. Years of school completed—families with householder 25 years and over, by total money income in 1985, age, and race of householder	82
25. Type of income, by income of specified type in 1985—families and unrelated individuals, by sex, race, and Hispanic origin of householder	86
26. Type of income, by total money income in 1985—families and unrelated individuals, by age of householder	92
 Persons	
27. Selected characteristics of persons—number with income and median income in 1985 and 1984 of all persons 15 years and over and persons working year-round, full-time, by sex	98
28. Total CPS population and per capita money income in 1967-85 (in current and constant dollars), by race, and Hispanic origin	100
29. Persons 14 years and over, by total money income in 1947-85 (in current dollars), work experience, race, and sex	101
30. Persons 14 years and over, by total money income in 1947-85 (in constant 1985 dollars), work experience, race, and sex	104
31. Type of residence—persons 15 years and over, by total money income in 1985, race, and sex	107
32. Regions and divisions—persons 15 years and over, by total money income in 1985, race, Hispanic origin, and sex	110
33. Marital status—persons 18 years and over, by total money income in 1985, age, race, Hispanic origin, and sex	118
34. Age—persons 15 years and over, by total money income in 1985, race, and sex	126
35. Education and total money income in 1985—persons 25 years and over, by age, race, and sex	131
36. Education and total money earnings in 1985—number with earnings, mean earnings, and standard errors in 1985 of persons 18 years and over, by age, work experience, and sex	139
37. Type of income, by income of specified type in 1985—persons 15 years and over, by race, Hispanic origin, and sex	141
38. Type of income, by total money income in 1985—persons 15 years and over, by age and sex	146
39. Occupation of longest job in 1985—civilian workers 15 years and over, by total money earnings in 1985, work experience, and sex	152
40. Occupation of longest job in 1985, race, and Hispanic origin—number with earnings, mean earnings, and standard errors in 1985 of civilian workers 18 years and over, by work experience and sex	160
41. Work experience in 1985—civilians 15 years and over, by total money earnings in 1985, race, Hispanic origin, and sex	161

Money Income of Households, Families, and Persons in the United States: 1985

NOTE

Income data in this report for 1985 are the first estimates based entirely on households selected from the 1980 census-based sample design. Estimates by type of residence categories such as metropolitan, nonmetropolitan, farm, and nonfarm, which were omitted from the 1984 report because of the mixed 1970 and 1980 census sampling frame used for the March 1985 CPS, have been resumed in this report. The residence categories reflect metropolitan areas defined as of June 1984. In addition, the March 1986 CPS income supplement was revised to allow for the coding of larger earnings amounts on the questionnaire. A description of this change and its effect on income estimates is in the section discussing the revised earnings question.

INCOME OF HOUSEHOLDS

Median household income in 1985 was \$23,620, an increase of 5.4 percent over the 1984 median of \$22,420, according to results of the March 1986 Current Population Survey (CPS) conducted by the Bureau of the Census. After adjusting for the increase in consumer prices between 1984 and 1985, real median household income increased by about 1.7 percent.¹ The 1985 median income was \$24,910 for White households, \$14,820 for Black households, and \$17,470 for Hispanic households. White and Black households showed an increase in real income between 1984 and 1985, but the observed change for Hispanic households was not statistically significant.

INCOME OF FAMILIES

For the third year in a row, median family money income continued to move ahead of inflation. In 1985, median family income was \$27,740, 4.9 percent higher than the 1984 median of \$26,430. After adjusting for the 3.6-percent increase in consumer prices between 1984 and 1985, real median family income increased by 1.3 percent. The 1.3-percent real increase in family income between 1984 and 1985 follows increases of 2.8 percent for 1983-84 and 1.6 percent for 1982-83.²

Both White families and Black families posted gains in real median income in 1985. The median income for White families was \$29,150, 1.7 percent higher than in 1984. The median income for Black families was \$16,790, 5.0 percent higher than in 1984. Median income for Hispanic families, \$19,030

in 1985, showed no statistically significant change from 1984.³

The median income of married-couple families was \$31,100 in 1985; with the wife in the paid labor force it was \$36,430, both amounts were significantly higher in real terms than in 1984. In March 1986, about 80 percent of all families were married couples of which 54 percent had a wife in the paid labor force. Ten years earlier, 84 percent of all families were married couples of which 44 percent had the wife in the paid labor force.

The median income for families with a female householder, no husband present, was \$13,660 in 1985, not statistically different from the 1984 figure.

Data by educational attainment level of the family householder indicate that families in which the householder's formal education ended after four years of high school had a median income of \$27,470 in 1985. By contrast, families with a householder completing exactly 4 years of college had a median income of \$43,190, and those with 5 or more years of college had a median of \$50,530.

EARNINGS OF YEAR-ROUND, FULL-TIME WORKERS

While the median earnings of men, \$24,200, showed no statistically significant change from 1984, the earnings of women, \$15,620, rose by 2.1 percent in real terms. In 1985, 66.3 percent of civilian male workers 15 years old and over worked year-round, full-time; this compares with 48.5 percent of women. Ten years earlier, 62.7 percent of men and 40.6 percent of women worked year-round, full-time.

PER CAPITA INCOME

Per capita income is computed by dividing the total aggregate money income by the total population. Basically, it

¹Changes in real income refer to comparisons after adjusting for inflation. The percent change in prices between 1984 and 1985 was computed by dividing the annual average Consumer Price Index (CPI) for 1985 by the annual average value of the CPI for 1984. See table A-1 of appendix A for CPI's from 1947 to 1985.

²The percent change in median income between 1982 and 1983 was not significantly different from the 1983-84 or 1984-85 changes.

³The percent changes in median family income for Whites, Blacks, and Hispanics were not statistically different from one another.

Table A. Comparison of Median Family Money Income in 1985 and 1984, by Selected Characteristics

Characteristic	Median family money income			Percent change in real money income
	1985	1984		
		Constant dollars	Current dollars	
All families	\$27,735	\$27,376	\$26,433	*1.3
Race of Householder				
White	29,152	28,674	27,686	*1.7
Black	16,786	15,983	15,432	*5.0
Hispanic ¹	19,027	19,505	18,833	-2.5
Education of Householder²				
Elementary: Total	15,370	15,470	14,937	-0.6
High school: 4 years	27,472	27,475	26,528	-
College: Total	39,487	38,629	37,298	*2.2
1 to 3 years	32,177	31,759	30,665	1.3
4 years	43,187	42,177	40,724	*2.4
5 years or more	50,525	48,321	46,656	*4.6
Type of Family				
Married-couple families	31,100	30,669	29,612	*1.4
Wife in paid labor force	36,431	35,905	34,668	*1.5
Wife not in paid labor force	24,556	24,423	23,582	0.5
Male householder, no wife present	22,622	24,157	23,325	*-6.4
Female householder, no husband present	13,660	13,260	12,803	3.0

- Represents zero.

*Significant at the 95-percent confidence level.

¹Persons of Hispanic origin may be of any race.

²Restricted to householders 25 years old and over.

is the amount of income per person, for every man, woman, and child in the CPS noninstitutional population. Per capita income differs from family income in that it includes the income of all persons 15 years old and over, whereas family income is restricted to the income of persons 15 years and over related to the householder and living in households. Changes in family income do not, therefore, reflect the changes in income for other segments of the population, such as unrelated individuals, or the fact that the characteristics of families are changing. Changes in family characteristics, such as declines in average family size or decreases in the proportion of married couples, can affect the family income. Use of per capita income provides a measure that includes all population segments and is less affected by changes in family composition.⁴

Over the past 10 years, the change in real per capita income differs significantly from that of median family income. For example, between 1975 and 1985 per capita income has increased an average of about 1.2 percent per year. This compares with an average annual change in median family income of about 0.1 percent per year.⁵ In 1985, real per capita money income in the United States was \$11,010 up 2.1 percent from

1984. The per capita income of Whites in 1985 was \$11,670 up 2.0 percent from 1984; for Blacks it was \$6,840 up 4.9 percent, and for Hispanics it was \$6,610, unchanged from 1984.⁶ The percent changes in per capita income between 1984 and 1985 for Whites, Blacks, and Hispanics were not statistically different from one another.

The income estimates were obtained from the Census Bureau's Current Population Survey (CPS) of March 1986. The survey includes both the civilian noninstitutional population and an estimated 746,000 members of the Armed Forces living off post or with their families on post in the United States. The March 1986 CPS population was 236,749,000 persons, comprising 63,558,000 family householders, 140,405,000 other family members (including 51,227,000 children under 15 years old), 1,281,000 persons in unrelated subfamilies, and 31,507,000 unrelated individuals (including 155,000 children under 15 years old); unrelated individuals are persons living alone or not related to others in the household. The collection of income data in the survey, however, is restricted to persons 15 years old and over. (See table B.)

Household income differs from family income in that household income includes not only the income of all related persons in the household but also the income of any unrelated

⁴For a further discussion on changing family composition, see Special Demographic Analyses, CDS-80-7, *Changing Family Composition and Income Differentials*. For further discussion of income trends, see Paul Ryscavage, "Reconciling Divergent Trends in Real Income," *Monthly Labor Review*, July 1986, pp. 24-29.

⁵The 0.1-percent annual average change in median family income was not statistically significant.

⁶The percent change in per capita income between 1984 and 1985 is based on a 1985 amount consistent with 1984 topcoded to \$99,999. (See the section on "Revisions to the Earnings Question on the March 1986 CPS.")

persons in the household. Household income also includes the income of one-person households. Family income is limited to the income of persons in a family household which, by definition, must contain two or more related persons.

Since the estimates in this report are based on a sample, they are subject to sampling variability. Particular care should be exercised in the interpretation of figures based on relatively small numbers of cases. Moreover, as in all field surveys of income, the figures are subject to errors of response and nonreporting. For further details see the section, "Reliability of Estimates," in appendix B.

Data on consumer income collected in the CPS are limited to money income received before payments of Federal, State, local, or Social Security (FICA) taxes and before any other types of deductions such as union dues or Medicare premiums. Money income is the sum of amounts received from earnings; Social Security and public assistance payments; dividends, interest, and rent; unemployment and worker's compensations; government and private employees pensions; and other periodic income. (Certain money receipts such as capital gains are not included.) Therefore, money income does not reflect the fact that some families receive part

of their income in the form of noncash benefits such as food stamps, health benefits, and subsidized housing; that some farm families receive noncash benefits in the form of rent-free housing and goods produced and consumed on the farm; or that noncash benefits are also received by some nonfarm residents, such as the use of business transportation and facilities, full or partial payments by business for retirement programs, and medical and educational expenses. These elements should be considered when comparing income levels.

Moreover, readers should be aware that for many different reasons there is a tendency in household surveys for respondents to underreport their income.⁷ Underreporting tends to be more pronounced for income sources that are not derived from earnings, such as Social Security, unemployment compensation, public assistance, and net income from interest, dividends, and rentals. Overall, income earned from wages or salary is much better reported than other sources of income, and when dollar imputations are assigned for nonreporting, total wage and salary income approximates independently derived estimates.

In recent years the Bureau of the Census has conducted research concerning alternative measures for valuing noncash or in-kind benefits. This research has focused on the valuation of in-kind food, housing, and medical care transfers received by the low-income population. Initial results of this research were published in 1982 in Technical Paper 50, *Alternative Methods for Valuing Selected In-Kind Transfer Benefits and Measuring Their Effect on Poverty*. The Bureau has continued to update estimates yearly, with the most recent data being published in Technical Paper 56, *Estimates of Poverty Including the Value of Noncash Benefits: 1985*.

Table B. Derivation of the CPS Universe and Population Characteristics of the March 1986 CPS

Population groups	Number (thous.)	Percent distribution
Total resident population	240,331	100.0
Minus:		
Civilian institutional population	2,834	1.2
Armed Forces living without families on post in the United States	746	0.3
Equals:		
Population total for the CPS universe	236,749	98.5
Total CPS population	236,749	100.0
Civilian noninstitutional population	235,661	99.5
Armed Forces living off post or with families on post in the United States	1,090	0.5
Total CPS population	236,749	100.0
In families	203,963	86.2
Family householders	63,558	26.8
Married-couple families	50,933	21.5
Male householder, no wife present	2,414	1.0
Female householder, no husband present	10,211	4.3
Other family members	140,405	59.3
Spouse of householder	50,933	21.5
Other related members 15 and over	38,245	16.2
Male	20,560	8.7
Female	17,685	7.5
Other related members under 15	51,227	21.6
Male	26,233	11.1
Female	24,994	10.6
In unrelated subfamilies	1,281	0.5
Unrelated individuals	31,507	13.3
15 years and over	31,352	13.2
Male	14,339	6.1
Female	17,013	7.2
Under 15 years	155	0.1
Male	75	-
Female	80	-

REVISIONS TO THE EARNINGS QUESTION ON THE MARCH 1986 CPS

The Census Bureau has made a revision to the March CPS income supplement questionnaire in an effort to adapt to continually rising levels of annual income. Beginning with the March 1986 CPS, question number 48, which covers the amount of earnings received from the employer or own business for which the respondent worked the longest during the previous calendar year, was modified to permit coding of earnings amounts to a maximum of \$299,999. Prior to March 1986, procedures allowed for coding of amounts to a maximum of \$99,999. In March 1977, about 127,000 weighted sample persons reported receiving earnings in the previous calendar year in excess of the \$99,999 maximum. In March 1986, when the revision was made, about 627,000 weighted sample persons reported receiving earnings in excess of this maximum. About 16,000 weighted sample

⁷The accuracy of reported and imputed CPS earnings and property income is discussed in a paper, "Measuring the Impact on Income Statistics of Reporting Differences Between the Current Population Survey and Administrative Sources," by Roger A. Herriot and Emmett F. Spiers, published in the American Statistical Association, *Proceedings of the Social Statistics Section*, 1975.

persons reported earnings amounts that exceeded the revised maximum of \$299,999.

This change in the questionnaire causes a break in the time series for some income measures. Table C has been included

Table C. Comparison of 1985 Income Measures for Households, Families, and Persons, by Earning Limit, Race, and Hispanic Origin

Income measure	Earnings limited to—								Percent change due to increased earnings limit

to indicate the effect of the questionnaire revision on selected income measures. Overall, the revision added about \$22.9 billion to the total aggregate income that would have gone undetected had the \$99,999 limit continued. Mean income, per capita income, shares of aggregate income by quintile and the index of income concentration (GINI Index) were all affected by the revision and caution should be used when comparing these income summary measures for 1985 to earlier years.

RELATED REPORTS

Current Population Survey. Other data based on the Current Population Survey showing the distributions of households, families, unrelated individuals, and persons by income levels have been published in Series P-60 reports, Nos. 1 to 107, 109, and 114 to 155. Frequently, tables showing the cross-classification of income and other characteristics have been published in the Series P-20 and P-23 reports of the Bureau of the Census and in the Special Labor Force Reports of the Bureau of Labor Statistics. An advance report showing 1985 income data cross-classified by selected characteristics of families, persons, and households, and the poverty population was issued as Series P-60, No. 154.

Data on educational attainment and expected lifetime earnings have been assembled from information collected in the Current Population Survey. These data appear in Series P-60, No. 139, *Lifetime Earnings Estimates for Men and Women in the United States: 1979*. Included in the report are estimates of expected lifetime earnings in 1981 constant dollars (based upon 1979-centered data) by years of school completed, age, and sex, for all persons and for year-round, full-time workers.

A historical and analytical summary of the income data collected in the Current Population Survey appears in Technical Paper 17, *Trends in the Income of Families and Persons in the United States: 1947 to 1964*, published in 1967. This report contains detailed tables showing income distributions in constant (1964) dollars, mean incomes, fifths, and Gini ratios of families and unrelated individuals cross-classified by various characteristics, for the United States, nonfarm, and farm populations. Similar data are shown for males and females classified by the amount of their own income and various personal characteristics. An update to Technical Paper 17 can be

obtained at cost by writing to the Bureau of the Census. The reproduced copy contains income summary measures such as means, medians, shares of aggregate income, and Gini ratios for families and persons by various demographic characteristics for the years 1947 through 1979 in constant 1977 dollars.

Data on the receipt of noncash benefits in 1985 appear in Current Population Reports, Series P-60, No. 155, *Receipt of Selected Noncash Benefits: 1985*.

Decennial census. Summary income statistics for households, families, and persons are presented in PHC80-2, Parts 2 to 53, *Census Tracts*; PHC80-3, Parts 2 to 53, *Summary Characteristics for Governmental Units and Standard Metropolitan Statistical Areas*; PHC80-4, Parts 2 to 53, *Congressional Districts of the 98th Congress*; PHC80-S2, Parts 2 to 53, *Advance Estimates of Social, Economic, and Housing Characteristics*; PC80-1-C, Parts 2 to 53, *General Social and Economic Characteristics*; and PC80-1-D, Parts 2 to 53, *Detailed Population Characteristics*.

Statistics on income in 1979 collected in the March 1980 CPS differ from data from the 1980 decennial census despite the fact that the same basic concept was used in both instances. First, the CPS data excluded the institutional population and most members of the Armed Forces living on post; these two groups were included in the census. Second, college students were generally enumerated at their own homes in the CPS and classified as family members, but were enumerated at their college residence in the census, usually as secondary individuals.

Third, the small group of CPS enumerators was more experienced and had more intensive training and supervision than the large number of temporary census enumerators and may have more often obtained more accurate answers from respondents. Furthermore, approximately 95 percent of the households were self-enumerated in the 1980 census.

In general, the census provides higher estimates of income than the CPS. Median family income reported in the 1980 census was about \$19,917, 1.7 percent higher than the comparable figure of \$19,587 derived from the March 1980 CPS.⁸

⁸The differences between CPS and Census income estimates are discussed in a paper, "Quality and Comparability of Personal Income Data from Surveys and the Decennial Census," by George F. Patterson, presented at the Plenary Session of the Joint Advisory Committee Meeting on April 25, 1985, in Rosslyn, Virginia.

¹BASED ON REVISED METHODOLOGY.

¹ALL RACES, WHITE, BLACK AND OTHER RACES (1947-100); BLACK (1967-100); AND SPANISH ORIGIN OF HOUSEHOLDER (1972-100).

NOTE: BEGINNING WITH THE YEAR 1979, DATA ARE BASED ON HOUSEHOLDER CONCEPT AND RESTRICTED TO PRIMARY FAMILIES. FOR THE YEARS 1960 TO 1970 THE NUMBER OF WHITE AND BLACK-AND-OTHER-RACES FAMILIES AND UNRELATED INDIVIDUALS WILL NOT ADD TO ALL RACES BECAUSE THE NUMBERS FOR ALL RACES WERE ADJUSTED TO POPULATION CONTROLS BASED ON THE 1970 CENSUS; THESE CONTROLS ARE NOT AVAILABLE BY RACE. FOR THE YEARS 1979 TO 1985, DATA ARE BASED ON 1980 CENSUS POPULATION CONTROLS.

Table 10. Families and Unrelated Individuals, by Total Money Income in 1947-85 (in Current Dollars), Race, and Hispanic Origin of Householder--Continued

(FAMILIES AND UNRELATED INDIVIDUALS AS OF MARCH OF THE FOLLOWING YEAR. FOR MEANING OF SYMBOLS, SEE TEXT)

Table with columns: RACE AND SPANISH ORIGIN OF HOUSEHOLDER AND YEAR, NUMBER (THOUS.), TOTAL, PERCENT DISTRIBUTION (UNDER \$2,500 to \$50,000 AND OVER), VALUE (DOL.), INDEX. Rows include categories like BLACK AND OTHER RACES, BLACK, and SPANISH ORIGIN OF HOUSEHOLDER with data for years 1947-1985.

BASED ON REVISED METHODOLOGY.

ALL RACES, WHITE, BLACK AND OTHER RACES (1947-100); BLACK (1967-100); AND SPANISH ORIGIN OF HOUSEHOLDER (1972-100). PERSONS OF SPANISH ORIGIN MAY BE OF ANY RACE.

NOTE: BEGINNING WITH THE YEAR 1979, DATA ARE BASED ON HOUSEHOLDER CONCEPT AND RESTRICTED TO PRIMARY FAMILIES. FOR THE YEARS 1960 TO 1970 THE NUMBER OF WHITE AND BLACK-AND-OTHER-RACES FAMILIES AND UNRELATED INDIVIDUALS WILL NOT ADD TO ALL RACES BECAUSE THE NUMBERS FOR ALL RACES WERE ADJUSTED TO POPULATION CONTROLS BASED ON THE 1970 CENSUS; THESE CONTROLS ARE NOT AVAILABLE BY RACE. FOR THE YEARS 1979 TO 1985, DATA ARE BASED ON 1980 CENSUS POPULATION CONTROLS.

¹BASED ON REVISED METHODOLOGY.

²ALL RACES, WHITE, BLACK AND OTHER RACES (1947-100); BLACK (1967-100); AND SPANISH ORIGIN OF HOUSEHOLDER (1972-100). PERSONS OF SPANISH ORIGIN MAY BE OF ANY RACE.

NOTE: BEGINNING WITH THE YEAR 1979, DATA ARE BASED ON HOUSEHOLDER CONCEPT AND RESTRICTED TO PRIMARY FAMILIES. FOR THE YEARS 1960 TO 1970 THE NUMBER OF WHITE AND BLACK-AND-OTHER-RACES FAMILIES AND UNRELATED INDIVIDUALS WILL NOT ADD TO ALL RACES BECAUSE THE NUMBERS FOR ALL RACES WERE ADJUSTED TO POPULATION CONTROLS BASED ON THE 1970 CENSUS; THESE CONTROLS ARE NOT AVAILABLE BY RACE. FOR THE YEARS 1979 TO 1985, DATA ARE BASED ON 1980 CENSUS POPULATION CONTROLS.

Table 11. Families and Unrelated Individuals, by Total Money Income in 1947-85 (in Constant 1985 Dollars), Race, and Hispanic Origin of Householder

(FAMILIES AND UNRELATED INDIVIDUALS AS OF MARCH OF THE FOLLOWING YEAR. FOR MEANING OF SYMBOLS, SEE TEXT)

Table 12. Income at Selected Positions and Percentage Share of Aggregate Income in 1947-85 Received by Each Fifth and Top 5 Percent of Families and Unrelated Individuals, by Race of Householder—Continued

(IN CURRENT DOLLARS. FAMILIES AND UNRELATED INDIVIDUALS AS OF MARCH OF THE FOLLOWING YEAR. FOR MEANING OF SYMBOLS, SEE TEXT)

RACE OF HOUSEHOLDER AND YEAR	NUMBER (THOUS.)	INCOME AT SELECTED POSITIONS (DOLLARS)					PERCENT DISTRIBUTION OF AGGREGATE INCOME						MEAN INCOME (DOLS.)	INDEX OF INCOME CONCENTRATION
		UPPER LIMIT OF EACH FIFTH				TOP 5 PERCENT	LOWEST FIFTH	SECOND FIFTH	MIDDLE FIFTH	FOURTH FIFTH	HIGHEST FIFTH	TOP 5 PERCENT		
		LOWEST	SECOND	MIDDLE	FOURTH									
FAMILIES --CON.

Table 12. Income at Selected Positions and Percentage Share of Aggregate Income in 1947-85 Received by Each Fifth and Top 5 Percent of Families and Unrelated Individuals, by Race of Householder—Continued

(IN CURRENT DOLLARS. FAMILIES AND UNRELATED INDIVIDUALS AS OF MARCH OF THE FOLLOWING YEAR. FOR MEANING OF SYMBOLS, SEE TEXT)

RACE OF HOUSEHOLDER AND YEAR	NUMBER (THOUS.)	INCOME AT SELECTED POSITIONS (DOLLARS)					PERCENT DISTRIBUTION OF AGGREGATE INCOME						MEAN INCOME (DOLS.)	INDEX OF INCOME CONCENTRATION
		UPPER LIMIT OF EACH FIFTH				TOP 5 PERCENT	LOWEST FIFTH	SECOND FIFTH	MIDDLE FIFTH	FOURTH FIFTH	HIGHEST FIFTH	TOP 5 PERCENT		
		LOWEST	SECOND	MIDDLE	FOURTH									
UNRELATED INDIVIDUALS--CON.

¹PERSONS OF SPANISH ORIGIN MAY BE OF ANY RACE.

Appendix A. Definitions, Explanations, and Comparability of Data

DEFINITIONS AND EXPLANATIONS

Population coverage. This report includes the civilian noninstitutional population of the United States and approximately 1,090,000 members of the Armed Forces in the United States living off post or with their families on post, but excludes all other members of the Armed Forces.

Farm-nonfarm residence. The farm population refers to rural residents living on farms. The March 1980 CPS to March 1986 CPS employed a different definition of a farm than used in past Current Population Surveys or decennial censuses before 1980. Under the new definition, as used in the 1974 Census of Agriculture, a farm is any place in rural territory from which \$1,000 or more of agricultural products were sold in the reporting year. All other households were classified as non-farm, which comprises persons living in urban areas and persons not on farms living in rural areas. Rural persons in institutions, motels, and tourist camps, and those living on rented places where no land is used for farming are classified as nonfarm population.

According to the old definition, farm residence was determined by responses to two questions: (1) "Does this place you (own/rent) have 10 acres or more?" and (2) "During the past 12 months, how much did sales of crops, livestock and other farm products from this place amount to (under \$50, \$50 to \$249, \$250 to \$999, or \$1,000 or more)?" The household was classified as being in the farm population if either (a) the acreage response was "yes" and sales amounted to \$50 or more or (b) the acreage response was "no" and sales amounted to \$250 or more.

The method of determining farm residence in Current Population Surveys prior to 1960 was to ask the question, "Is this house on a farm (or ranch)?" All persons living on farms as determined by the answer to the question constituted the farm population. However, persons on "farms" who paid cash rent for a house and yard only were classified as nonfarm, and, as in the present definition, all rural persons in institutions, motels, and tourist camps were classified as nonfarm.

Metropolitan-nonmetropolitan residence. The population residing in metropolitan statistical areas (MSA's) constitutes the metropolitan population. MSA's are defined by the Office of Management and Budget for use in the presentation of statistics by agencies of the Federal Government. An MSA is a geographic area consisting of a large population nucleus, together with adjacent communities which have a high degree of economic and social integration with that nucleus. The

definitions specify a boundary around each large city so as to include most or all its suburbs. Entire counties form the MSA building blocks, except in New England where cities and towns are used. The former term SMSA was changed to MSA in 1983.

An area qualifies for recognition as an MSA if (1) it includes a city of at least 50,000 population, or (2) it includes a Census Bureau-defined urbanized area of at least 50,000 with a total metropolitan population of at least 100,000 (75,000 in New England). In addition to the county containing the main city or urbanized area, an MSA may include other counties having strong commuting ties to the central county. If specified conditions are met, certain large MSA's are designated as consolidated MSA's (CMSA's) and divided into component primary MSA's (PMSA's).

Central cities. The largest city in each MSA is always designated a central city. There may be additional central cities if specified requirements, designed to identify places of central character within the MSA, are met. Although the largest central cities are generally included in the title of the MSA, there may be central cities that are not part of the title. The balance of the MSA outside the central city or cities often is regarded as equivalent to "suburbs."

Geographic regions. The four major regions and nine Census divisions of the United States for which data are presented in this report represent groups of States as follows:

Northeast:

New England: Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, and Vermont.

Middle Atlantic: New Jersey, New York, and Pennsylvania.

Midwest (formerly North Central):

East North Central: Illinois, Indiana, Michigan, Ohio, and Wisconsin.

West North Central: Iowa, Kansas, Minnesota, Missouri, Nebraska, North Dakota, and South Dakota.

South:

South Atlantic: Delaware, District of Columbia, Florida, Georgia, Maryland, North Carolina, South Carolina, Virginia, and West Virginia.

East South Central: Alabama, Kentucky, Mississippi, and Tennessee.

West South Central: Arkansas, Louisiana, Oklahoma, and Texas.

West:

Mountain: Arizona, Colorado, Idaho, Montana, Nevada, New Mexico, Utah, and Wyoming.

Pacific: Alaska, California, Hawaii, Oregon, and Washington.

North and West:

Northeast, Midwest, and West combined.

Tenure. A housing unit is "owner occupied" if the owner or co-owner lives in the unit, even if it is mortgaged or not fully paid for. A cooperative or condominium unit is "owner occupied" only if the owner or co-owner lives in it. All other occupied units are classified as "renter occupied," including units rented for cash rent and those occupied without payment of cash rent. For renter-occupied units, information was also obtained as to whether the unit was publicly owned or subsidized by the Federal, State, or local government.

Mobility status. The population of the United States 1 year old and over has been classified according to mobility status on the basis of a comparison of the place of residence of each individual at the time of the March 1986 CPS and place of residence 1 year earlier. Nonmovers are all persons who were living in the same house at the beginning and end of the period. Movers are all persons who were living in a different house at the end of the period than at the beginning of the period. Movers from abroad include all persons, either citizens or aliens, whose place of residence was outside the United States at the beginning of the period, that is, in an outlying area under the jurisdiction of the United States or in a foreign country.

Income. For each person in the sample 15 years old and over, questions were asked on the amount of money income received in the preceding calendar year from each of the following sources: (1) money wages or salary; (2) net income from nonfarm self-employment; (3) net income from farm self-employment; (4) Social Security or railroad retirement; (5) Supplemental Security income; (6) public assistance or welfare payments; (7) interest (on savings or other investments which pay interest); (8) dividends, income from estates or trusts, or net rental income; (9) veterans' payments or unemployment and worker's compensation; (10) private pensions or government employee pensions; (11) alimony or child support, regular contributions from persons not living in the household, and other periodic income.

It should be noted that although the income statistics refer to receipts during the preceding year the characteristics of the person, such as age, and labor force status, and the composition of families refer to the time of the survey. The income of the family does not include amounts received by persons who were members of the family during all or part of the income year if these persons no longer resided with the family at the time of enumeration. However, family income includes amounts reported by related persons who did not reside with the family during the income year but who were members of the family at the time of enumeration.

Data on consumer income collected in the CPS by the Bureau of the Census cover money income received (exclusive of certain money receipts such as capital gains) before payments for personal income taxes, Social Security, union dues, Medicare deductions, etc. Therefore, money income does not reflect the fact that some families receive part of their income in the form of noncash benefits such as food stamps, health benefits, and subsidized housing; that some farm families receive noncash benefits in the form of rent-free housing and goods produced and consumed on the farm; or that non-cash benefits are also received by some nonfarm residents which often take the form of the use of business transportation and facilities, full or partial payments by business for retirement programs, medical and educational expenses, etc. These elements should be considered when comparing income levels. Moreover, readers should be aware that for many different reasons there is a tendency in household surveys for respondents to underreport their income. From an analysis of independently derived income estimates, it has been determined that income earned from wages or salaries is much better reported than other sources of income, and is nearly equal to independent estimates of aggregate income.

The various sources for which income is reported are defined as follows:

Money wages or salary is total money earnings received for work performed as an employee during the income year. It includes wages, salary, Armed Forces pay, commissions, tips, piece-rate payments, and cash bonuses earned, before deductions were made for taxes, bonds, pensions, union dues, etc.

Net income from nonfarm self-employment is net money income (gross receipts minus expenses) from one's own business, professional enterprise, or partnership. Gross receipts include the value of all goods sold and services rendered. Expenses include costs of goods purchased, rent, heat, light, power, depreciation charges, wages and salaries paid, business taxes (not personal income taxes), etc. In general, inventory changes were considered in determining net income; replies based on income tax returns or other official records do reflect inventory changes. However, when values of inventory changes were not reported, net income figures exclusive of inventory changes were accepted. The value of saleable merchandise consumed by the proprietors of retail stores is not included as part of net income.

Net income from farm self-employment is net money income (gross receipts minus operating expenses) from the operation of a farm by a person on his own account, as an owner, renter, or sharecropper. Gross receipts include the value of all products sold, government farm programs, money received from the rental of farm equipment to others, and incidental receipts from the sale of wood, sand, gravel, etc. Operating expenses include cost of feed, fertilizer, seed, and other farming supplies, cash wages paid to farmhands, depreciation charges, cash rent, interest on farm mortgages, farm building repairs, farm taxes (not State and Federal personal income taxes), etc. The value of fuel, food, or other farm

products used for family living is not included as part of net income. In general, inventory changes were considered in determining net income only when they were accounted for in replies based on income tax returns or other official records which reflect inventory changes; otherwise inventory changes were not taken into account.

Social Security includes Social Security pensions and survivors' benefits, and permanent disability insurance payments made by the Social Security Administration prior to deductions for medical insurance and railroad retirement insurance checks from the U.S. Government. Medicare reimbursements are not included.

Supplemental Security income includes payments made by Federal, State, and local welfare agencies to low income persons who are (1) aged (65 years old or over), (2) blind, or (3) disabled.

Public assistance or welfare payments include public assistance payments, such as aid to families with dependent children and general assistance.

Dividends, interest (on savings or other investments which pay interest), income from estates or trusts, net rental income, or royalties include dividends from stockholdings or membership in associations, interest on savings or any type of investment which pays interest, periodic receipts from estates or trust funds, net income from rental of a house, store, or other property to others, receipts from boarders or lodgers, and net royalties.

Unemployment compensation, veterans' payments, or worker's compensation include (1) unemployment compensation received from government unemployment insurance agencies or private companies during periods of unemployment and any strike benefits received from union funds; (2) money paid periodically by the Veterans Administration to disabled members of the Armed Forces or to survivors of deceased veterans, subsistence allowances paid to veterans for education and on-the-job training, as well as so-called "refunds" paid to ex-servicemen as GI insurance premiums; and (3) worker's compensation received periodically from public or private insurance companies for injuries incurred at work. The cost of this insurance must have been paid by the employer and not by the person.

Private and government employee pensions include (1) private pensions or retirement benefits paid to a retired person or his survivors by a former employer or by a union, either directly or through an insurance company and (2) government employee pensions received from retirement pensions paid by Federal, State, county, or other governmental agencies to former employees (including members of the Armed Forces) or their survivors.

Annuities, alimony, regular contributions from persons not living in the household, and other periodic income include (1)

periodic receipts from annuities or insurance; (2) alimony and child support; (3) contributions received periodically from persons not living in the household; (4) other periodic income such as military family allotments, net gambling winnings, and other kinds of periodic income other than earnings.

Government transfer payments include Social Security or railroad retirement, public assistance or welfare payments, Supplemental Security income, retirement and annuities, veterans' payments, and unemployment and worker's compensations.

Receipts not counted as income. Receipts from the following sources were not included as income: (1) money received from the sale of property, such as stocks, bonds, a house, or a car (unless the person was engaged in the business of selling such property, in which case the net proceeds would be counted as income from self-employment); (2) withdrawals of bank deposits; (3) money borrowed; (4) tax refunds; (5) gifts; and (6) lump-sum inheritances or insurance payments.

All sources of income may be combined into two major types:

Total money earnings. The algebraic sum of money wages or salary and net income from farm and nonfarm self-employment.

Income other than earnings. The algebraic sum of all sources of money income except wages and salaries and income from self-employment.

Total money income. This is defined as the algebraic sum of money wages and salaries, net income from self-employment, and income other than earnings. The total income of a family is the algebraic sum of the amounts received by all income recipients in the family.

The income tables for families and unrelated individuals include in the lowest income group (under \$2,500) those who were classified as having no income in the income year and those reporting a loss in net income from farm and nonfarm self-employment or in rental income. Some of these were living on income "in-kind," savings, or gifts, or were newly constituted families, unrelated individuals who had recently left families, or families in which the sole earner had recently died or had left the household. However, other families or unrelated individuals who reported no income probably had some money income which was not recorded in the survey.

Median income. The median income is the amount which divides the distribution into two equal groups, one having incomes above the median, and the other having incomes below the median. The medians for households, families, and unrelated individuals are based on all households, families and unrelated individuals. The medians for persons are based on persons with income.

Mean income. The mean income is the amount obtained by dividing the total income of a group by the number of units

in that group. The means for households, families, and unrelated individuals are based on all households, families, and unrelated individuals. The means for persons are based on persons with income.

Per capita income. Per capita income is the mean income computed for every man, woman, and child in a particular group. It is derived by dividing the total income of a particular group by the total population (excluding patients or inmates in institutional quarters) in that group.

Index of income concentration. The index of income concentration (or Gini index) is a statistical measure of income equality ranging from 0 to 1. A measure of 1 indicates perfect inequality, i.e., one person having all the income and the rest having none. A measure of 0 indicates perfect equality, i.e., all persons having equal shares of the income. For a more detailed discussion see Current Population Reports, Series P-60, No. 123.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is either (1) direct access from the outside or through a common hall or (2) a kitchen or cooking equipment for the exclusive use of the occupants.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

Group quarters. All persons who are not members of households are regarded as living in group quarters. Group quarters contain five or more persons unrelated to the person in charge, such as residents of lodging and boarding houses. Persons living in military barracks and inmates of institutions were excluded from the survey.

Head versus householder. Beginning with the 1980 CPS, the Bureau of the Census discontinued the use of the terms "head of household" and "head of family." Instead, the terms "householder" and "family householder" are used. Recent social changes have resulted in greater sharing of household responsibilities among the adult members and, therefore, have made the term "head" increasingly inappropriate in the analysis of household and family data. Specifically, the Bureau has discontinued its longtime practice of always classifying the husband as the reference person (head) when he and his wife are living together.

Householder. The instructions call for listing first the person (or one of the persons) in whose name the home is

owned or rented. If the house is owned jointly by a married couple, either the husband or the wife may be listed first, thereby becoming the reference person, or householder, to whom the relationship of the other household members is recorded. One person in each household is designated as the "householder." The number of householders, therefore, is equal to the number of households.

Family. A family is a group of two persons or more (one of whom is the householder) related by birth, marriage, or adoption and residing together; all such persons (including related subfamily members) are considered as members of one family. Beginning with the 1980 CPS, unrelated subfamilies (referred to in the past as secondary families) are no longer included in the count of families, nor are the members of unrelated subfamilies included in the count of family members.

Family household. A family household is a household maintained by a family (as defined above), and any unrelated persons (unrelated subfamily members and/or secondary individuals) who may be residing there are included. The number of family households is equal to the number of families. The count of family household members differs from the count of family members, however, in that the family household members include all persons living in the household, whereas family members include only the householder and his/her relatives. (See the definition of family.)

Unrelated subfamily. An unrelated subfamily (formerly called a secondary family) is a group of two persons or more who are related to each other by birth, marriage, or adoption, but who are not related to the householder. The unrelated subfamily may include persons such as guests, roomers, boarders, or resident employees and their relatives living in a household. The number of unrelated subfamily members is included in the number of household members but is not included in the count of family members.

Persons living with relatives in group quarters were formerly considered as members of unrelated subfamilies. However, the number of such unrelated subfamilies became so small (37,000 in 1967) that beginning with data for 1968 (and beginning with census data for 1960) the Bureau of the Census includes persons in these unrelated subfamilies in the count of secondary individuals.

Married couple. A married couple, as defined for census purposes, is a husband and wife enumerated as members of the same household. The married couple may or may not have children living with them. The expression "husband-wife" or "married-couple" before the term "household," or "family," indicates that the household, or family, is maintained by a husband and wife.

Unrelated individuals. The term "unrelated individuals" refers to persons 15 years old and over (other than inmates of institutions) who are not living with any relatives. An unrelated

individual may (1) constitute a one-person household, (2) be part of a household including one or more other families or unrelated individuals, or (3) reside in group quarters such as a rooming house. Thus, a widow living by herself or with one or more other persons not related to her, a lodger not related to the householder or to anyone else in the household, and a servant living in an employer's household with no relatives are examples of unrelated individuals.

Nonfamily householder. A nonfamily householder (formerly called a primary individual) is a person maintaining a household while living alone or with nonrelatives only.

Secondary individual. A secondary individual is a person in a household or group quarters such as a guest, roomer, boarder, or resident employee (excluding nonfamily householders and inmates of institutions) who is not related to any other person in the household or group quarters. (See section on unrelated subfamily for slight change in coverage of secondary individuals in 1968.)

Size of household, family, or subfamily. The term "size of household" includes all persons occupying a housing unit. "Size of family" includes the family householder and all other persons in the living quarters who are related to the householder by birth, marriage, or adoption.

Own children and related children under 18 years of age. "Own" children in a family are sons and daughters, including stepchildren and adopted children of the householder. "Related" children in a family include own children and all other children in the household who are related to the householder by blood, marriage, or adoption.

Related persons and family members. In the classification of households by number of related persons, the person or couple who maintains the household (or housing unit) and all persons in the household related to them are included. In the classification of families by number of family members, all persons in the family are included. The number of family members is the same as the size of the family.

Marital status. The marital status classification identifies four major categories: single, married, widowed, and divorced. These terms refer to the marital status at the time of the enumeration.

The category "married" is further divided into "married, wife present," "separated," and "other married, wife absent" for male householders and "married, husband absent" by reason for absence of husband for female householders. A male householder was classified as "married, wife present" if his wife was reported as a member of the household, even though she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration. Persons reported as separated included those with legal

separations, those living apart with intentions of obtaining a divorce, and other persons permanently or temporarily separated because of marital discord. The groups "other married, wife absent" and "other married, husband absent" included married persons living apart because either the wife or the husband was employed and living at a considerable distance from home, was residing in an institution, had moved to another area, or had a different place of residence for any other reason except separation as defined above.

Number of earners. This number includes all persons in the household with \$1 or more in wage and salaries or \$1 or more or a loss in net income from farm or nonfarm self-employment.

Age. The age classification is based on the age of the person at his last birthday.

Race. The population is divided into three groups on the basis of race: White, Black, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except White and Black. "Other races" are sometimes shown in combination with the Black population.

Persons of Spanish origin. Persons of Spanish origin were identified by a question that asked for self-identification of the person's origin or descent. Respondents were asked to select their origin (and the origin of other household members) from a "flash card" listing ethnic origins. Persons of Spanish origin, in particular, were those who indicated that their origin was Mexican, Puerto Rican, Central or South American, or some other Spanish origin. It should be noted that persons of Spanish origin may be of any race.

Years of school completed. Data on years of school completed were derived from the combination of answers to questions concerning the highest grade of school attended by the person and whether or not that grade was finished. The questions of educational attainment apply only to progress in "regular" schools. Such schools included public, private, and parochial elementary and high schools (both junior and senior), colleges, universities, and professional schools (whether day schools or night schools). Thus, regular schooling is that which may advance a person toward an elementary school certificate, a high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to school in the regular school system.

The median years of school completed is defined as the value which divides the distribution into two equal groups, one having completed more schooling and one having completed less schooling than the median. These medians are expressed in terms of a continuous series of numbers representing years of school completed. For example, a median of 9.0 represents the completion of the first year of high school and a median of 13.0 means completion of the first year of college.

Labor force and employment status. The definitions of labor force and employment status relate to the population 15 years old and over.

Employed. Employed persons comprise (1) all civilians who, during the survey week containing March 12, 1986 did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (such as own home housework, and painting or repairing own home) or volunteer work for religious, charitable, and similar organizations.

Unemployed. Unemployed persons are those civilians who, during the survey week containing March 12, 1986, had no employment but were available for work and (1) had engaged in any specific jobseeking activity *within the past 4 weeks*, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) were waiting to be called back to a job from which they had been laid off, or (3) were waiting to report to a new wage or salary job within 30 days.

Labor force. Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" is comprised of all civilians classified as employed or unemployed.

Not in the labor force. All civilians who are not classified as employed or unemployed are defined as "not in the labor force." This group who are neither employed nor seeking work includes persons engaged only in own home housework, who were attending school or were unable to work because of long-term physical or mental illness; persons who are retired or too old to work, seasonal workers for whom the survey week fell in an off season, and the voluntarily idle. Persons doing only unpaid family work (less than 15 hours during the specified week) are also classified as not in the labor force.

Paid labor force. Persons are classified in the paid labor force if they were employed as wage and salary workers or self-employed workers during the survey week containing March 12, 1986, or were looking for work at the time and had last worked as wage and salary or self-employed worker.

Occupation. The data on occupation in tables 9, 14, 27, 39, and 40 refer to the job held longest during the income year.

The occupation groupings were derived from occupation subgroups delineated on the basis of the classification system used in the 1980 census. For more detailed information, see the February 1983 issue of *Employment and Earnings* by the Bureau of Labor Statistics.

Work experience. A person with work experience is one who, during the preceding calendar year, did any civilian work for pay or profit or worked without pay on a family-operated farm or business at any time during the year, on a part-time or full-time basis.

Weeks worked in the income year. Persons are classified according to the number of different weeks, during the preceding calendar year, in which they did any civilian work for pay or profit (including paid vacations and sick leave) or worked without pay on a family-operated farm or business.

Part-time or full-time jobs. A person is classified as having worked at part-time jobs during the preceding calendar year if he worked at civilian jobs which provided less than 35 hours of work per week in a majority of the weeks in which he worked during the year. He is classified as having worked at full-time jobs if he worked 35 hours or more per week during a majority of the weeks in which he worked.

Year-round, full-time worker. A year-round, full-time worker is one who worked primarily at full-time civilian jobs for 50 weeks or more during the preceding calendar year.

Nonworker. A nonworker is one who did not do any civilian work in the calendar year preceding the survey.

Symbols. A dash (—) represents zero or rounds to zero, the symbol "B" means that the base for the derived figure is less than 75,000, the symbol "X" means not applicable, the symbol "NA" means not available, and the symbol "r" means revised.

Rounding. Percentages are rounded to the nearest tenth of a percent; therefore, the percentages in a distribution do not always add to exactly 100.0 percent. The totals, however, are always shown as 100.0. Moreover, individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded; percentages are based on the unrounded numbers.

Base figures. The base figures shown for 1979 to 1985 are based on civilian noninstitutional population controls for age, race, and sex established by the 1980 census. The base figures shown for 1971 to 1978 were prepared by inflating weighted sample results to agree with independent estimates of the population based on statistics updated from the 1970 census, whereas the base figures for the years from 1961 to 1970 were inflated to estimates derived from the 1960 census. The data for the years prior to 1961 were based on the 1950 census.

Computation of aggregate income by fifths. The data shown on aggregate income and dollar cutoffs for fifths (and top 5 percent) of families, ranked by size of their total money income, were calculated using estimates from grouped data, as described below:

1. In calculating the aggregate income by fifths (and top 5 percent) of families using grouped data, the underlying aggregate income distribution by size of income was estimated initially. The aggregate income distributions were obtained by multiplying the number of units in each income interval by an estimated mean income for the corresponding income interval. For the top open-end interval (\$75,000 and over), a Pareto distribution was fitted to the data in the interval just below the open-end interval (\$60,000 to \$74,999). This fitted distribution was then extrapolated to estimate the number of families with incomes greater than \$100,000. The mean income of families with greater than \$100,000 was assumed to be \$100,000 exactly. The mean income for the \$75,000 to \$100,000 interval was estimated from the same fitted Pareto distribution. Below the "\$75,000 and over" interval, a Pareto distribution was fitted to each separate income interval. If the absolute value of the slope parameter of the fitted Pareto distribution was greater than 1, the mean income of the interval was estimated from the fitted Pareto distribution. If the absolute value of the slope parameter was less than or equal to 1, the midpoint of the interval was used as the estimated mean of the interval.
2. The upper income levels (quantiles) of each fifth and the top 5 percent of families were estimated using either linear or Pareto interpolation depending upon the methods used to estimate the mean income in the interval in which the quantile was located (reference interval). After determining a particular quantile, the aggregate income above this quantile was calculated by estimating the aggregate income of the subinterval between the quantile and the next higher actual income interval and adding the result to the aggregate income above the reference interval. The aggregate income of the subinterval was determined using the method (either Pareto or linear interpolation) consistent with that used for estimating the quantile and the mean income of the reference interval. The aggregate incomes between the quantiles were determined by disaccumulating the aggregate income distribution.

For more information on the use of Pareto techniques, see "Estimation of Summary Measures of Income Size Distribution from Grouped Data," by Emmett F. Spiers, published in the American Statistical Association *Proceedings of the Social Statistics Section*, 1977.

Computation of constant dollar distributions. For the years 1968 to 1984, adjustment for price change was made by converting the incomes of households, families, or persons on the microdata file into 1985 dollars on the basis of the Con-

sumer Price Index (CPI). The microdata was then tallied into the appropriate income interval. Data prior to 1968 was converted using existing grouped data. In choosing a procedure to make this conversion, two fundamental assumptions concerning income data were made: (1) price changes have the same proportional effect on various income levels and (2) the distribution within each income interval follows a Pareto distribution. The following procedure satisfies these two assumptions.

The first step required the accumulation of the income distribution starting with the highest income interval and cumulating to the lowest income interval. Next, the limits of each income interval were converted into 1985 dollars by adjusting them by a factor representing the change on the basis of that year's price index (1977 = 100). Finally, the number of families in each of the detailed class intervals were computed by logarithmic interpolation and then combined into broad income intervals.

The indices used to make the constant dollar conversions are shown in table A-1. The Consumer Price Index (CPI) is an index designed to measure changes in family purchasing power. While the CPI is a good measure of the changes in prices paid by the average family represented in the index (urban consumers), it is not necessarily a good measure of the changes in prices faced by consumers of different characteristics and income levels. These limitations should be noted when comparing income figures adjusted to constant dollars using the CPI since the same index was used for all families and all income levels.

Table A-1. Annual Average Consumer Price Index (CPI): 1947 to 1985

Year	CPI	Year	CPI
1947	36.9	1966	53.6
1948	39.7	1967	55.1
1949	39.3	1968	57.4
1950	39.7	1969	60.5
1951	42.9	1970	64.1
1952	43.8	1971	66.8
1953	44.1	1972	69.0
1954	44.4	1973	73.3
1955	44.2	1974	81.4
1956	44.8	1975	88.8
1957	46.4	1976	93.9
1958	47.7	1977	100.0
1959	48.1	1978	107.0
1960	48.9	1979	119.8
1961	49.4	1980	136.0
1962	49.9	1981	150.1
1963	50.5	1982	159.3
1964	51.2	1983	164.4
1965	52.1	1984	171.4
		1985	177.5

COMPARABILITY OF CURRENT POPULATION SURVEY INCOME DATA WITH OTHER DATA

Bureau of Economic Analysis (BEA) personal income series. The income data presented in this report are not directly

*Individual income amounts greater than or equal to \$100,000 are recorded as \$99,999 in the Current Population Survey.

comparable with estimates of aggregate personal income prepared by the Bureau of Economic Analysis (formerly the Office of Business Economics), Department of Commerce, nor with the distributions of families and unrelated individuals by family personal income brackets published by that Bureau between the years 1929 to 1963. The lack of correspondence stems from the following differences in definition and coverage:

1. *Income definition.* The personal income series include, among other items, the following types of nonmoney income which are not included in the census definition: wages received in kind, the value of food and fuel produced and consumed on farms, the net rental value of owner-occupied homes, the property income received by mutual life insurance companies, and the value of the services of banks and other financial intermediaries rendered to persons without the assessment of specific charges. These items of income in kind account for about 4 percent of total personal income. The Census Bureau definition of income, on the other hand, includes such items as regular contributions for support received from persons who do not reside in the same living quarters, income received from roomers and boarders residing in households, and employee contributions for social insurance, which are not included in the personal income series. These items, however, represent a much smaller income total than the nonmoney items included in personal income.
2. *Source of data.* The personal income series is estimated largely on the basis of data derived from business and governmental sources. These sources include the industrial and population censuses, employer's wage reports under the Social Security programs, and records of disbursements to individuals by governmental agencies. The income data presented in the census reports, on the other hand, are based directly on field surveys of households.

As discussed in the section, "Source and Reliability of Estimates," income data obtained in household interviews are subject to various types of reporting errors which tend to produce an understatement of income. It is estimated that the income surveys conducted by the Bureau of the Census during the past few years have obtained about 90 percent of the comparable total money income aggregates and about 98 percent of the comparable money wage or salary aggregates derived from the personal income series prepared by BEA.

For a more detailed discussion of the differences between distributions using Census money income and BEA personal income, see "Size Distribution of Family Personal Income: Methodology and Estimates for 1964," by Edward C. Budd, Daniel B. Radner, and John C. Hinrichs, Bureau of Economic Analysis, BEA-SP 73-21, June 1973.

3. *Population coverage.* The Bureau of the Census excluded from its sample inmates of institutions and military per-

sonnel overseas or living on post in the United States (except for a few families living on post). In addition the income of persons who died or emigrated prior to the date of interview was not reported in the census inquiry. The income of these groups is included in the aggregate personal income series released by the BEA.

4. *Average income.* The average income figures (e.g., for geographical regions) represent income per capita, i.e., they were derived by dividing total income by the total population including men, women, and children. Most of the census averages, in contrast, are for households, families, unrelated individuals, or income recipients 15 years old and over.

Department of Agriculture farm income series. The farm income data are not directly comparable to that published by the U.S. Department of Agriculture (USDA) for several reasons. The USDA publishes two major series on income of farms: (1) net farm income and (2) net cash farm income.

For reasons listed below, the estimates of farm self-employment income per person or per family as published by the Bureau of the Census differ from estimates of operators' net farm income or net cash farm income per farm as published by the Department of Agriculture:

1. The unit of analysis in the USDA estimates is an establishment (farm) rather than a household as in the Bureau of the Census estimate.
2. The estimates of farm self-employment income as published by the Bureau of the Census and USDA's net cash income series exclude the nonmoney income items of crops grown for home consumption and an imputed rental value for farm dwellings. However, these are included in the estimates of operators' net farm income per farm.
3. The USDA estimate of net farm income includes the value of the change in inventories of commodities from the beginning to the end of the year. The USDA net cash farm income and the Bureau of the Census farm self-employment income do not.
4. The USDA series include the net income of farm operators from the rental of farms to other farmers but the census definition classifies these receipts as income other than earnings, not income from farm self-employment.
5. The USDA series is based on income from farms which are organized as proprietorships, partnerships, and corporations. The Bureau of the Census excludes corporate farm income. (The Bureau of Economic Analysis does estimate the proportions of the USDA estimate which are earned by corporate and noncorporate farms for inclusion in the National Income and Product Account.)

The estimates of the USDA differ from the estimates of the Bureau of the Census methodologically as well as conceptually. The USDA estimates are based on data derived

from the Census of Agriculture, farm surveys, business, and governmental sources, and are not available at a farm or household level, while the Bureau of the Census estimates are compiled from data collected in sample surveys. As noted later, the latter estimates are subject not only to sampling variation but also to errors of response and nonreporting.

For a more detailed discussion of the concepts and methodology used in the USDA estimates, see U.S. Department of Agriculture Handbook No. 365, *Major Statistical Series of the U.S. Department of Agriculture*, Vol. 3, "Gross and Net Farm Income," September 1969.

Federal income tax data. For several reasons, the income data shown in this report are not directly comparable with those which may be obtained from statistical summaries of income tax returns. Income, as defined for tax purposes, differ somewhat from the concept used by the Bureau of the Census. For example, certain types of receipts, such as veterans' payments, Social Security benefits, and relief payments, which constitute the main income source for some families, are excluded from income tax coverage. Moreover, the coverage of income tax statistics is less inclusive because single persons receiving less than \$3,430 (less than \$4,470 if 65 years old or over) and married couples receiving less than \$5,620 (\$6,660 if one spouse is 65 years old or over; \$7,700 if both are 65 or over) are not required to file returns. Furthermore, some income tax returns are filed as separate returns and others as joint returns; consequently, the income reporting unit is not consistently either a family or a person.

Old-Age, Survivors', Disability, and Health Insurance earnings record data. Census data shown in this report and the distributions made upon the basis of Old-Age, Survivors', Disability, and Health Insurance earnings record data differ for the reasons listed below.

1. The earnings of the following groups are not covered by the earnings record data: many Federal, State, and local government employees, some employees of nonprofit organizations, workers covered by the Railroad Retirement Act, and persons who are not covered by the program because of insufficient earnings, including some farm and nonfarm self-employed persons, some farm workers, and domestic servants.
2. Employees' earnings in excess of \$39,600 per employer are not covered by the earnings record data.
3. Income other than earnings is not covered by the earnings record data.
4. The earnings record data are based upon employers' Social Security tax reports and the Federal income tax returns of self-employed persons, while the data presented in this report are obtained by household interviews.

COMPARABILITY OF ESTIMATES FROM MARCH 1986 CPS WITH ESTIMATES FOR PREVIOUS YEARS

Estimates from the March 1980 CPS to the March 1986 CPS are in some instances not strictly comparable with

estimates for previous years due to several factors. Among these factors are changes in (1) population controls and metropolitan residence definitions; (2) collection of income and work experience data; (3) noninterviews, nonresponses, and allocations; (4) questionnaire wording and procedures; (5) sample size and interpolation procedures; and (6) definition of the income universe. Each of these factors is discussed in the following sections, and readers should consider these differences when comparing current with previous years' estimates.

Population Controls and Metropolitan Residence Definitions

In July 1985, the CPS began carrying the metropolitan statistical area definitions announced by the Office of Management and Budget on June 30, 1984. Figures published from the CPS in the early 1980's and throughout most of the 1970's referred to metropolitan areas as defined on the basis of the 1970 census. Since there are important differences in the population classified as metropolitan using the 1970 and 1984 definitions, comparisons should be avoided.

The new CPS metropolitan estimates have consistently been higher than independent estimates of the metropolitan population prepared by the Census Bureau; the new CPS nonmetropolitan estimates have been lower than the independent estimates. The magnitude of the monthly differences has varied from 900,000 to 2.5 million persons over the past year, so that the proportion of the population living in metropolitan areas according to the CPS has ranged from 0.4 to 1.0 percentage points higher than the independent estimate. The difference in level between the two sets of estimates is partially attributable to the basic CPS sample design, which, because of sampling variability, includes an oversample of metropolitan households and an undersample of nonmetropolitan households. The monthly variations result from the exit and entrance of rotation groups, each with slightly different metropolitan-nonmetropolitan proportions, into the sample. The apparent overestimation of metropolitan and underestimation of nonmetropolitan population in CPS relative to the Bureau's independent estimates should be taken into account when using the data.

The data for 1971 through 1985 are in some instances not entirely comparable to figures for earlier years because of revisions in the Current Population Survey. The estimates for 1979 to 1985 are based on civilian noninstitutional population established by the 1980 census. Starting in January 1972, 1970 census-based population controls, metropolitan residence definitions, and other materials were introduced into the sample and estimation procedures. The major item affecting comparability at the overall national level is the introduction of population controls based on the 1970 census. The data for 1971 through 1978 are based on civilian noninstitutional population established by the 1970 census. Figures for previous years are tied in with 1960 census-based population controls. In a number of instances, data from the March 1970 and 1971 CPS's were revised to take account of 1970

census-based population controls, thus providing some measure of the impact of the changes. (See table 3, Current Population Reports, Series P-60, No. 91.) Basically, these changes should have no substantial impact on summary measures, such as medians and means, and on proportional measures, such as percent distributions and low-income or poverty rates. However, the changes may have more impact on the population levels in different subgroupings, such as the total number of persons or families either overall, within some particular income interval, or below the low-income level. A detailed description of these changes appears in the Bureau of Labor Statistics report, *Employment and Earnings*, Vol. 18, No. 8, February 1972.

Comparability of metropolitan and nonmetropolitan data from the March 1980 CPS with data for previous years. Changes in the CPS design and procedures over the last several years have made the annual series of sample population data for metropolitan and nonmetropolitan areas inconsistent. Analytic comparisons of year-to-year changes in these figures should be avoided. Trends in metropolitan and nonmetropolitan population growth over the 1970-83 period should not be appreciably affected by the procedural changes.

The major revisions to earlier CPS sample design and estimation methods have involved the varying of the number of sample units. Incorporation of approximately 10,000 supplemental housing units into the March CPS sample in 1977 was accompanied by new procedures for inflating the sample results to reflect national estimates. It was determined subsequent to the introduction of the additional sample that the new inflating (weighting) procedures used for processing both the March 1977 and March 1978 CPS supplement data had resulted in an apparent overestimate of the nonmetropolitan population and corresponding underestimate of the metropolitan population for those years. For the March 1979 CPS, another revision of the weighting process was introduced to correct the problem discovered in the earlier procedures. The result of this change was a large spurious increase in the metropolitan population and decrease in the nonmetropolitan population relative to March 1978 CPS levels.

Collection of Income and Work Experience Data

This report presents data showing income of persons and family householders with varying amounts of work experience. In the surveys from March 1966 to March 1969, civilian work experience data collected in the February and April surveys were matched with income data collected in the March survey for all households. In the surveys prior to March 1966 only persons included in the February and March surveys were matched.

Nonmatched persons included in the February and March interviews or the March and April interviews were almost always assigned work experience information from actual respondents with similar economic and demographic characteristics. Work experience values were estimated only when there was a nonmatched person with a given classifica-

tion, but no respondent with similar economic and demographic characteristics.

No April or February 1969 survey record could be found for about 6 percent of the people included in the March 1969 survey. The major reasons for these nonmatches were migration, noninterviews, and coding errors. In order to eliminate the nonmatches and to improve the consistency between income and work experience data, both the income and work experience data were collected together beginning with the March 1970 survey.

The remaining persons, whose work experience data were assigned, resulted from inconsistencies between their work experience and income data and from persons who did not answer the work experience questions. It should be noted that the proportions of year-round, full-time workers shown in the Series P-60 reports differ slightly from those shown for the same subgroups in the Bureau of Labor Statistics, *Special Labor Force Reports*, "Work Experience of the Population." The difference exists because the proportions are not based on exactly the same groups. The proportions presented in the Special Labor Force Reports relate to civilians who worked at some time during the year. In contrast, the proportions shown in the persons tables in the P-60 reports relate to civilians who received income, including not only workers but also many persons who did not work but received income from pensions, interest, dividends, or other sources aside from earnings.

Noninterviews, Nonresponses, and Allocations

In the March 1986 CPS, no interview was obtained for approximately 4 percent of the 60,500 households in the sample. No interview was obtained at these households during the enumeration week for reasons such as "no one home," "temporarily absent," or "refusals." In order to account for these households, the weights assigned to households in which interviews were obtained have been increased slightly. This "noninterview" adjustment procedure adjusts the weights of sample households by race of householder and within a specified set of geographical restrictions.

The nonresponse problem, which is sometimes referred to as "item nonresponse," is a serious problem in most household surveys and is especially troublesome for income. Even though an interview is obtained in many cases, complete information for all of the income questions is not available, unknown or refused. In March 1986, the income data were incomplete for about 27 percent of the persons 15 years old and over. About 32 percent of the families had one or more members with incomplete income information. In order that the maximum amount of information can be utilized, missing income items are imputed or allocated by values which are obtained from active respondents with similar economic and demographic characteristics.

Questionnaire Wording and Procedures

Modifications in collecting income data in the March 1979 Current Population Survey. As part of the March 1979 CPS,

the Bureau conducted an experiment in an effort to improve the reporting of income data. An alternative questionnaire was used on three of the eight rotation groups. The experimental questionnaire used more probing questions and inquired about more detailed sources of income. The results of the experiment and its subsequent impact on the estimates are discussed in the Current Population Reports, Series P-60, No. 123, page 12.

Modifications in collecting income data in the March 1980 Current Population Survey. A modified version of the experimental questionnaire which was tested on three-eighths of the March 1979 sample was used for the full sample in March 1980. The experimental questionnaire contained a number of modifications designed to improve income reporting. For further discussion, see the section, "Modifications to the March 1980 CPS" presented earlier.

Definition of the Income Universe

Starting in the March 1980 CPS, a decision was made to restrict the universe for presenting income data to persons 15 years old and over instead of 14 years old and over. This change was made to establish consistency between the results from the March 1980 CPS and the 1980 Census of Population. Although income data were collected for persons 14 years old and over, the income of the 14-year-olds was not used for processing and tabulation purposes.

The March 1980 CPS also incorporated the use of the "householder" concept rather than the traditional "head" concept. Under the new procedure, the householder is the first adult household member listed on the questionnaire. The instructions call for listing first the person (or one of the persons) in whose name the home is owned or rented.

Another change made in the March 1980 CPS was the exclusion of secondary families (now called unrelated subfamilies) from the count of all families. This modification was required because of the introduction of the householder concept, since unrelated subfamilies do not have a householder. For more discussion on all of these changes, see the section, "Modifications to the March 1980 CPS," Current Population Reports, Series P-60, No. 129.

UNDERREPORTING OF INCOME

As in most household surveys, the estimated total amount of income received by persons derived from the March CPS is somewhat less than estimated amounts derived from independent sources, such as the Bureau of Economic Analysis, the Social Security Administration, and the Veterans Administration. The difference between the survey estimate and the independent estimate is termed "underreporting."

In order to estimate the magnitude of underreporting on the CPS, estimates of aggregate money income are made from independent sources (for each income source) by adjusting aggregate income figures from these sources to CPS money income concepts. One of the more important adjustments is the exclusion of "nonmoney" income amounts such as pay

to employees in the form of food or lodging or imputed rent of owner-occupied housing from aggregate personal income figures obtained from BEA. A publication covering the general topic of income underreporting is *The Distribution of Personal Income, A Study of Statistics on the Size Distribution of Personal Income in the United States*, prepared by T. Paul Schultz for use by the Subcommittee on Economic Statistics of the Joint Economic Committee, Congress of the United States, 1964. For more details regarding the procedures for developing independent estimates of aggregate income, see "Appraisal of Basic Data Available for Constructing Income Size Distributions" by Selma F. Goldsmith, published in *Studies in Income and Wealth*, Volume 13, National Bureau of Economic Research, 1951; and "Size Distribution of Family Personal Income: Methodology and Estimates for 1964," by Edward C. Budd, Daniel B. Radner, and John C. Hinrichs, Bureau of Economic Analysis, BEA-SP 73-021, June 1973.

Because of the difficulty in obtaining reliable independent estimates of aggregate income for some individual sources of income collected in the CPS, the independent estimates shown in table A-2 do not include figures for (1) estates or trusts, (2) alimony and child support, (3) contributions from persons not living in the household, (4) general assistance, and (5) the "anything else" category. Independent estimates of aggregate nonfarm and farm self-employment income are based on the BEA personal income series even though they pose some troublesome conceptual problems. It should also be kept in mind that the independent estimates are, themselves, subject to errors and conceptual differences for which no adequate adjustment is possible.

The data in table A-2 show comparisons of CPS aggregate money income in 1983 with independent estimates. Data for 1984 were not available at the time this publication went to print. Comparisons of the 1984 CPS estimates with the independent totals reveal that overall income in the survey after allocation is underreported by about 10 percent. However, wide variations are found in the amount of underreporting by source of income. Underreporting varied from about 45 percent for interest income to only about 1 percent for wage and salary income. Both reported and allocated proportions of CPS aggregate incomes are shown in table A-2.

In 1983, \$442.2 billion, or about 20 percent of the total aggregate income was allocated as a result of nonresponses to the income questions. About 13 percent of the \$10.5 billion of the CPS public assistance or welfare income in 1983 was allocated, while about 33 percent of the \$119.8 billion of nonfarm self-employment income was allocated. Other sources of income with allocated proportions of 30 percent or above include interest and dividends.

The reasons for underreporting of income in the 1985 CPS and in other household surveys are many and varied. Some of the more important of these reasons include (1) respondent's overlooking income received (especially small amounts not regularly received), (2) reluctance to reveal the receipt of certain income types, (3) reporting rounded amounts, (4) misunderstanding the questions, (5) lack of information especially covering family members not present during the

interview, (6) interviewer's errors in recording information on the questionnaire, (7) biases in the allocation of nonresponses, and (8) errors resulting from the aggregation of the information collected from individual questionnaires.

For more details on income underreporting in censuses and surveys, see (1) *Income Distribution in the United*

States (a 1960 Census Monograph), by Herman P. Miller, Bureau of the Census, 1966; (2) *The Structure of Income*, by Irving B. Kravis, University of Pennsylvania, 1962; and (3) "Size Distribution of Family Personal Income: Methodology and Estimates for 1964," cited earlier in this section.

Table A-2. Comparison of CPS Aggregate Money Income in 1983 With Independent Estimates of Aggregate Money Income Adjusted to CPS Money Income Concepts, by Type of Income and Reported and Allocated CPS Amounts

Appendix B. Source and Reliability of Estimates

SOURCE OF DATA

Most of the estimates in this report are based on data obtained in March 1986 from the Current Population Survey (CPS) conducted by the Bureau of the Census and from supplementary questions to the CPS. Some estimates are based on data obtained from the CPS in earlier years. The monthly CPS deals mainly with labor force data for the civilian noninstitutional population. Questions relating to labor force participation are asked about each member in every sample household. In addition, supplementary questions are asked every March about money income for the previous year. In order to obtain more reliable data for the Hispanic population, the March CPS sample was enlarged to include all households from the previous November sample which contained at least one sample person of Hispanic origin. For this report, persons in the Armed Forces living off post or with their families on post are also included.

CPS Sample Design

Since the inception of the CPS in 1940, the sample has been redesigned several times, most recently in the early 1980's, to upgrade the quality and reliability of the data and to meet changing data needs. The present CPS sample was selected from the 1980 decennial census files with coverage in all 50 States and the District of Columbia. The sample is continually updated to reflect new construction. The current CPS sample is located in 729 sample areas comprising 1,973 counties, independent cities, and minor civil divisions in the Nation. In this sample, approximately 59,500 occupied households were eligible for interview.¹ Of this number, about 2,500 occupied units were visited but interviews were not obtained because the occupants were not found at home after repeated calls or were unavailable for some other reasons.

The following table provides a description of some aspects of the CPS sample designs in use during the referenced data collection periods.

CPS estimation procedure. The estimation procedure used in this survey involved the inflation of weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, sex, and Hispanic/non-Hispanic categories. These independent estimates are based on statistics from the 1980 decennial census; statistics on births, deaths, immigration, and emigration; and statistics on the strength of the Armed Forces.

¹Numbers reflect the initial size of the CPS sample and do not include expansions for Hispanic households.

Description of the Current Population Survey

Interview period	Number of sample areas	Housing units eligible	
		Interviewed	Not interviewed
1986	729	57,000	2,500
1985	629/729	57,000	2,500
1982-84	629	59,000	2,500
1980-81	629	65,000	3,000

Beginning with reports containing income data for 1980, the independent population estimates used to obtain data for years 1979 and later are based on the 1980 census. In earlier reports in this series (P-60), data for 1971 through 1979 were obtained using independent population estimates based on the 1970 decennial census, 1979 being the bridge year. Similar procedures were used in earlier decades. For more details on this change, see the section of the text "Introduction of 1980 Census Population Controls," Series P-60, No. 132.

The estimates in this report for 1985 are also based on a revised Hispanic weighting procedure for persons of Hispanic origin. In previous years the estimation procedures used in this survey involved the inflation of weighted sample results to independent estimates of the noninstitutional population by age, sex, and race. There was, therefore, no specific control of the survey estimates for the Hispanic population. During the last several years, the Bureau of the Census has developed independent population controls for the Hispanic population by sex and detailed age groups and has adopted revised weighting procedures to incorporate these new controls. It should be noted that the independent population estimates include some, but not all, undocumented immigrants. The estimation procedure also involved a further adjustment so that husband and wife of a household received the same weight.

RELIABILITY OF ESTIMATES

Since the CPS estimates were based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same questionnaires, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey: sampling and nonsampling. The accuracy of a survey result depends on both types of errors, but the full extent of the nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences

between estimates. The standard errors provided for the CPS estimates primarily indicate the magnitude of the sampling error. They also partially measure the effect of some non-sampling errors in response and enumeration, but do not measure any systematic biases in the data. Bias is the difference, averaged over all possible samples, between the estimate and the desired value. Obviously, the accuracy of a survey result depends on the sampling and nonsampling errors measured by the standard error and on the bias and other types of nonsampling error not measured by the standard error. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates.

Nonsampling variability. Nonsampling errors can be attributed to many sources; e.g., inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness on the part of the respondents to provide correct information, inability to recall information, errors made in collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all units with the sample (undercoverage).

Undercoverage in the CPS results from missed housing units and missed persons within sample households. Overall CPS undercoverage, as compared to the level of the 1980 decennial census is about 7 percent. It is known that CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races combined than for Whites. Ratio estimation to independent age-sex-race population controls, as described previously, partially corrects for the bias due to survey undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households to missed persons in interviewed households have different characteristics from interviewed persons in the same age-sex-race group. Further, the independent population controls used have not been adjusted for undercoverage in the decennial census.

In most cases the questionnaire entries for income are based on the memory or knowledge of one person, usually the wife. The memory factor in data derived from field surveys of income probably produces underestimates because the tendency is to forget minor or irregular sources of income. Other errors of reporting are due to misrepresentation or to misunderstanding of the scope of the income concept. See also the section entitled "Underreporting of Income."

Sampling variability. The standard errors given in tables B-1 through B-6 are primarily measures of sampling variability, that is, of the variation that occurred by chance because a sample rather than the entire population was surveyed. The sample estimate and its standard error enable one to construct confidence intervals—ranges that would include the average result of all possible samples with a known probability. For example, if all possible samples were selected, each of these being surveyed under essentially the same general conditions and

using the same sample design, and if an estimate and its standard error were calculated from each sample, then:

1. Approximately 95 percent of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average result of all possible samples.
2. Approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples.

The average estimate derived from all possible samples may or may not be contained in any particular computed interval. However, for a particular sample, one can say with a specified confidence that the average estimate derived from all possible samples is included in the confidence interval.

Standard errors may also be used to perform hypothesis testing, a procedure for distinguishing between population parameters using sample estimates. The most common types of hypotheses appearing in this report are: 1) the population parameters are identical, and 2) the population parameters are different. An example of this would be comparing the median household income for Whites versus the median household income for Blacks. Tests may be performed at various levels of significance, where a level of significance is the probability of concluding that the parameters are different when, in fact, they are identical.

To perform the most common test, let x and y be sample estimates for two characteristics of interest. A subsequent section explains how to derive a standard error on the difference $x-y$. Let that standard error be s_{DIFF} . Compute the ratio $R = (x-y)/s_{DIFF}$. If this ratio is between -2 and $+2$, no conclusion about the parameters is justified at the 0.05 level of significance. If, on the other hand, this ratio is smaller than -2 or larger than $+2$, the observed difference is significant at the 0.05 level. In this event, it is commonly accepted practice to say that the parameters are different. Of course, sometimes this conclusion will be wrong. When the parameters are, in fact, the same, there is a 5 percent chance of concluding that they are different.

All statements of comparison in the text have passed a hypothesis test at the 0.10 level of significance or better, and most have passed a hypothesis test at the 0.05 level of significance or better. This means that, for most differences cited in the text, the estimated difference between parameters is greater than twice the standard error of the difference. For the other differences mentioned, the estimated difference between parameters is between 1.6 and 2.0 times the standard error of the difference. When this is the case, the statement of comparison will be qualified in some way, e.g., by use of the phrase "some evidence."

Comparability of data. Caution should be used when comparing estimates for 1980 and later, which reflect 1980 census-based population controls, to those for 1971 through 1979, which reflect 1970 census-based population controls.

This change in population controls had relatively little impact on summary measures such as means, medians, and percent distribution, but did have a significant impact on levels. For example, use of 1980-based population controls resulted in about a 2-percent increase in the civilian noninstitutional population and in the number of families and households. Thus, estimates of levels for 1980 and later will differ from those for earlier years by more than what could be attributed to actual changes in the population and these differences could be disproportionately greater for certain subpopulation groups than for the total population.

A number of changes were made in data collection and estimation procedures beginning with the March 1980 CPS. The major changes were the use of a more detailed income questionnaire, the use of the "householder" concept instead of the traditional "head" concept, the introduction of the new farm definition, and use of more detailed income intervals in the upper range of the income distribution. Due to these and other changes, caution should be used in comparing estimates for 1979 through 1985 with estimates for earlier years. A description of these changes and the effect they had on the data is given in the section "Modifications to the March 1980 CPS" of an earlier report (Series P-60, No. 129).

Previously, the only postcensal figures for the size of Hispanic population came from the CPS itself (i.e., the old procedure did not have a separate population control for Hispanics). These figures proved to be low relative to the census and not stable over time. The new CPS procedure for Hispanics makes use of independent postcensal estimates for the Hispanic population as control totals to solve these problems. One consequence of the use of the new procedure is that besides the expected increase in the levels of the Hispanic population, there were increases in the levels of persons and households in poverty status. Thus, this change in procedure will affect comparisons across years, and caution should be used when comparing current estimates with those for earlier years. The data for 1983 were retabulated using the new procedure. Thus, year to year change from 1983 to 1984 was based on the new Hispanic controls. Data for earlier years were not retabulated. For a further discussion of the effect this new procedure has had on the data, see table C in Series P-60, No. 149 report.

Note when using small estimates. Summary measures (such as means, medians, and percent distributions) are shown in the report only when the base is 75,000 or greater. Because of the large standard errors involved, there is little chance that summary measures would reveal useful information when computed on a smaller base. Estimated numbers are shown, however, even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories as serve each user's needs. Also, care must be taken in the interpretation of small differences. For instance, even a small amount of nonsampling error can cause a borderline difference to appear significant or not, thus distorting a seemingly valid hypothesis test.

Estimation of median incomes. The methodology for computing median income has been changed over the past few years. The computations have been done using either Pareto interpolation or linear interpolation. Pareto interpolation assumes a decreasing density of population within an income interval, whereas linear interpolation assumes a constant density of population within an income interval. Estimates of median income for 1979 through 1985 and associated standard errors have been calculated using Pareto interpolation if the estimate is larger than \$20,000 for persons or \$40,000 for families and households. (That is where the width of the income interval containing the estimate is greater than \$2,500.) Estimates of median income for 1976, 1977, and 1978 and associated standard errors were calculated using Pareto interpolation if the estimate was larger than \$12,000 for persons or \$18,000 for families and households. (That is where the width of the income interval containing the estimate is greater than \$1,000.) All other estimates of median income and associated standard errors for 1976 through 1985 and almost all of the estimates of median income and associated standard errors for 1975 and earlier were calculated using linear interpolation. Thus, caution must be exercised when comparing median incomes above \$12,000 for persons or \$18,000 for families and households for different years. Median incomes below those levels are more comparable from year to year since they have always been calculated using linear interpolation. For an indication of the comparability of medians calculated using Pareto interpolation with medians calculated using linear interpolation, see Series P-60, No. 114, *Money Income in 1976 of Families and Persons in the United States*.

Standard error tables and their use. In order to derive standard errors that would be applicable to a large number of estimates and that could be prepared at a moderate cost, a number of approximations were required. Therefore, instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. As a result, the sets of standard errors provided give an indication of the order of magnitude of the standard error of an estimate rather than the precise standard error.

The figures presented in tables B-1 through B-6 are approximations to standard errors of various CPS estimates shown in this report for the year 1985. To obtain the approximate standard error for a specific characteristic, the appropriate standard error in table B-1 through B-6 must be multiplied by the "f" factor for that characteristic given in table B-7. These factors must be applied to the generalized standard errors in order to adjust for the combined effect of the sample design and the estimating procedure on the value of the characteristic.

Standard errors for intermediate values not shown in the generalized tables of standard errors may be approximated by linear interpolation. Standard errors of estimated means and medians are provided in the detailed tables.

Table B-1. Standard Errors of Estimated Numbers of Households, Families, Unrelated Individuals, and Persons: 1985

(Total and White)

(Numbers in thousands)

Size of estimate	Standard error ¹	Size of estimate	Standard error ¹
75	12	7,500	117
100	14	10,000	134
250	22	15,000	162
500	31	25,000	203
1,000	43	50,000	264
2,000	61	100,000	299
3,000	75	125,000	284
5,000	96	160,000	218

¹These values must be multiplied by the appropriate factor in table B-7 to obtain the correct standard error.

Note: To estimate standard errors for 1947 to 1954, multiply the above standard errors by 1.7; for 1955 to 1964 multiply by 1.3; for 1965 multiply by 1.1; and for 1966 to 1984 multiply by 0.95.

Two parameters (denoted "a" and "b") are used to calculate standard errors for each type of characteristic; they are presented in table B-7. These parameters were used to calculate the standard errors in tables B-1 through B-6 and to calculate the "f" factors in table B-7. They also may be used directly to calculate the standard errors for estimated numbers and percentages. Methods for computation are given in the following sections.

Standard errors of estimated numbers. The approximate standard error, S_x , of an estimated number shown in this report can be obtained in two ways. It may be obtained by use of the formula

$$S_x = fs \quad (1)$$

where f is the appropriate "f" factor from table B-7, and s is the standard error on the estimate obtained by interpolation from table B-1, B-3 or B-5. Alternatively, the standard error may be approximated by formula (2) from which the standard errors in tables B-1, B-3 and B-5 were calculated. Use of this formula will provide more accurate results than the use of formula (1) above.

$$S_x = \sqrt{ax^2 + bx} \quad (2)$$

Here x is the size of the estimate and a and b are the parameters in table B-7 associated with the particular type of characteristic.

Illustration of the computation of the standard error of an estimated number. Table 6 shows that in 1985 there were 63,558,000 family households in the United States. Table B-7 indicates that the appropriate "a" and "b" parameters to use in calculating a standard error for this estimate are $a = -0.000010$ and $b = 1,778$. Using formula (2), the approximate standard error is

$$269,000 = \sqrt{(-0.000010)(63,558,000)^2 + 1,778(63,558,000)}$$

The 95-percent confidence interval is from 63,020,000 to 64,096,000 (using twice the standard error). Therefore, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 95 percent of all possible samples.

Standard errors of estimated percentages. The reliability of an estimated percentage, computed using sample data for

Table B-2. Standard Errors of Estimated Percentages of Households, Families, Unrelated Individuals, and Persons: 1985

(Total and White)

Base of estimated percentage (thousands)	Estimated percentage ¹				
	2 or 98	5 or 95	10 or 90	25 or 75	50
75	2.2	3.5	4.8	6.9	7.9
100	1.9	3.0	3.1	6.0	6.9
250	1.2	1.9	2.6	3.8	4.4
500	0.9	1.3	1.8	2.7	3.1
1,000	0.6	0.9	1.3	1.9	2.2
2,000	0.4	0.7	0.9	1.3	1.5
3,000	0.4	0.5	0.8	1.1	1.3
5,000	0.3	0.4	0.6	0.8	1.0
7,500	0.2	0.3	0.5	0.7	0.8
10,000	0.2	0.3	0.4	0.6	0.7
15,000	0.16	0.2	0.3	0.5	0.6
25,000	0.12	0.2	0.3	0.4	0.4
50,000	0.09	0.13	0.2	0.3	0.3
100,000	0.06	0.09	0.13	0.2	0.2
125,000	0.05	0.08	0.12	0.2	0.2
160,000	0.05	0.08	0.10	0.15	0.2

¹These values must be multiplied by the appropriate factor in table B-7 to obtain the correct standard error.

Note: To estimate standard errors for 1947 to 1954, multiply the above standard errors by 1.7; for 1955 to 1964 multiply by 1.3; for 1965 multiply by 1.1; and for 1966 to 1984 multiply by 0.95.

Table B-3. Standard Errors of Estimated Numbers of Households, Families, Unrelated Individuals, and Persons: 1985

(Black and/or Other Races)

(Numbers in thousands)

Size of estimate	Standard error ¹	Size of estimate	Standard error ¹
75	12	3,000	74
100	14	5,000	91
250	23	7,500	105
500	32	10,000	112
1,000	45	15,000	113
2,000	62	20,000	95
		25,000	32

¹These values must be multiplied by the appropriate factor in table B-7 to obtain the correct standard error.

Note: To estimate the standard errors for 1947 to 1954, multiply the above standard errors by 1.7; for 1955 to 1964 multiply by 1.3; and for 1965 multiply by 1.1; and for 1966 to 1984 multiply by 0.95.

both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which this percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the factor or parameter from table B-7 indicated by the numerator. The approximate standard error, $S_{(x,p)}$, of an estimated percentage can be obtained by use of the formula

$$S_{(x,p)} = fs \tag{3}$$

In this formula, f is the appropriate factor from table B-7 and S is the standard error on the estimate from table B-2, B-4 or B-6. Alternatively, the standard error may be approximated by the following formula from which the standard errors in

tables B-2, B-4 and B-6 were calculated. Use of this formula will give more accurate results than use of formula (3) above.

$$S_{(x,p)} = \sqrt{(b/x) (p) (100-p)} \tag{4}$$

Here x is the size of the subclass of persons, or families and unrelated individuals which is the base of the percentage, p is the percentage ($0 < p < 100$), and b is the parameter in table B-7 associated with the particular type of characteristic in the numerator of the percentage.

Illustration of the computation of the standard error of an estimated percentage. Table 6 shows that of all family households, 10,211,000 or 16.1 percent were female householders with no husband present. Using formula (3) with $f=1.0$ and $s=0.2$ from table B-2, the standard error of 16.1 percent is $(1.0)(0.2)=0.2$. Alternatively, using formula (4) with the appropriate b parameter of 1,778 from table B-7, the standard error of 16.1 percent is given by

$$0.2 = \sqrt{\frac{1,778}{63,558,000} (16.1)(83.9)}$$

Consequently, the 95-percent confidence interval as shown by these data is from 15.7 to 16.5.

Standard error of a difference. For a difference between two sample estimates the standard error is approximately equal to

$$S_{(x-y)} = \sqrt{S_x^2 + S_y^2 - 2r S_x S_y} \tag{5}$$

where S_x and S_y are the standard errors for the estimates x and y as calculated above. The estimates can be numbers, percents, ratios, etc. The correlation coefficient can be deter-

Table B-4. Standard Errors of Estimated Percentages of Households, Families, Unrelated Individuals, and Persons: 1985

(Black and/or Other Races)

Base of estimated percentage (thousands)	Estimated percentage ¹				
	2 or 98	5 or 95	10 or 90	25 or 75	50
75	2.3	3.6	5.0	7.2	8.3

50	10
100	14
250	23
500	32
1,000	44
2,500	64
5,000	79
7,500	79
10,000	65
15,000	32

¹These values must be multiplied by the appropriate factor in table B-7 to obtain the correct standard error.

Note: To estimate standard errors for 1947 to 1954, multiply the above standard errors by 1.7; for 1955 to 1964 multiply by 1.3; for 1965 multiply by 1.1; and for 1966 to 1984 multiply by 0.95.

mined from table B-8 for year-to-year comparisons for income estimates (e.g., number of families with income less than \$5,000). For all other comparisons assume that r equals zero. Making this assumption will result in accurate estimates of standard errors for the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

Illustration of the computation of the standard error of a difference in estimates. Table 6 shows that the median income for all family households in 1985 was \$28,020 and for all non-family households was \$13,798. The apparent difference is \$14,224. The estimates of the standard errors of these medians (see the following section) are \$149 and \$166,

respectively. The standard error associated with the estimated difference of \$14,224 is:

$$223 = \sqrt{(149)^2 + (166)^2}$$

This means that the 95-percent confidence interval on the difference of \$14,224 as shown by these data is from \$13,778 to \$14,670. Therefore, a conclusion that the average estimate of the difference derived from all possible samples lies within a range computed in this way would be correct for roughly 95 percent of the time. Since this interval does not contain zero, we can conclude with 95-percent confidence that the median income of family households is greater than nonfamily households.

Standard error of a ratio. Certain mean values for persons in families or households shown in the tables of this report were calculated as the ratio of two numbers. For example, the mean number of persons per family or household is calculated as

$$\frac{x}{y} = \frac{\text{total number of persons in families or households}}{\text{total number of families or households}}$$

Standard errors for these means may be approximated as shown below. There are two cases to consider. In either case, the denominator y represents a count of families or households of a certain class, and the numerator x represents a count of persons with the characteristic under consideration who are members of these families or households.

Case 1. There is at least one person having the characteristic in every family or household of the class; for example, the mean number of persons per family or the mean number of persons per family with a male householder. For ratios of this kind, the standard error is approximated by the following formula:

$$S_{x/y} = \sqrt{\left(\frac{x}{y}\right)^2 \left[\left(\frac{S_y}{y}\right)^2 + \left(\frac{S_x}{x}\right)^2 - 2r \frac{S_x}{x} \frac{S_y}{y} \right]} \quad (6)$$

Table B-6. Standard Errors of Estimated Percentages of Households, Families, Unrelated Individuals, and Persons: 1985

(Hispanic Origin)

Base of percentage (thousands)	Estimated percentage ¹					
	1 or 99	2 or 98	5 or 95	10 or 90	25 or 75	50
75	1.7	2.3	3.6	5.0	7.2	8.3

1984	-0.000497	5,673	1.66
1985	-0.000548	6,426	1.76

¹These factors must be used with the standard errors obtained in tables B-1 through B-6.

The standard error of the estimated number of families or households, S_y , and the standard error of the estimated number of persons with the characteristic in those families or households, S_x , may be calculated by formula (1). Alternatively, formula (2) and table B-7 may be used by the method described above.

In formula (6), r represents the correlation coefficient between the numerator and the denominator of the estimate. In the above example, and for other ratios of this kind, use 0.7 as an estimate of r .

Case 2. The number of persons having the characteristic in a given family or household may be 0, 1, 2, 3, or more; for example, the mean number of persons under 18 years of age per household. For ratios of this kind the standard error is approximated by formula (6) but r is assumed to be zero. If r is actually positive (negative), then this procedure will provide an overestimate (underestimate) of the standard error of the ratio.

Note: When computing the approximate standard error of a ratio and the numerator of the ratio is income, use formula (7) for the standard error of an arithmetic mean. If the ratio has persons in the numerator and households in the denominator, then formula (6) with the appropriate value of r will give a result preferable to that of formula (7).

STANDARD ERRORS OF ESTIMATED MEANS AND MEDIANS

Estimated standard errors are provided for the means and medians of the published income distributions and do not need to be calculated by the user. However, because of the approximations used in developing the formula used to estimate the standard error of the mean, the standard error reported for this statistic will generally be an underestimate. Since some users may wish to combine two or more income distributions and compute means and medians for the combined distribution, the following sections have been provided to enable the user to calculate standard errors for these statistics.

Standard error of the mean. The formula used to estimate the standard error of a mean is

$$S_{\bar{x}} = \sqrt{(b/y) S^2} \quad (7)$$

In this formula, y is the size of the base of the distribution and b is a parameter which depends on the sample size, the sample design, the estimation procedure, and the type of characteristic. Values of b are given in table B-7. The variance, S^2 , is given by the following formula:

$$S^2 = \sum_{i=1}^c p_i x_i^2 - \bar{x}^2 \quad (8)$$

where \bar{x} is the mean of the distribution and is estimated by

$$\bar{x} = \sum_{i=1}^c p_i \bar{x}_i \quad (9)$$

c is the number of groups; i indicates a specific group, thus taking on values 1 through c .

p_i is the estimated proportion of households, families or persons whose values, for the characteristic (x -values) being considered, fall in group i .

$\bar{x}_i = (Z_{i-1} + Z_i)/2$ where Z_{i-1} and Z_i are the lower and upper interval boundaries, respectively, for group i .

Table B-8. Year-to-Year Correlation Coefficients for Income Characteristics: 1953 to 1985

Characteristic	Families and unrelated individuals	Persons
Total, White, Black and/or other races	0.35	0.30
Hispanic origin	0.55	0.45

Note: These correlations are for comparisons of consecutive years. For comparisons of nonconsecutive years, all correlations should be assumed zero. For comparisons involving years prior to 1953, all correlations are zero.

\bar{x}_i is assumed to be the most representative value for the characteristic for households, families or persons in group i . Group c is open-ended, i.e., no upper interval boundary exists. For this group the approximate average value is

$$\bar{x}_c = \frac{3}{2} Z_{c-1} \quad (10)$$

When two or more distributions are combined, the mean of the combined distribution is:

$$\bar{x} = \frac{1}{y} \sum_j \bar{x}_j y_j$$

where \bar{x}_j is the mean of the j^{th} distribution, y_j is the base of the j^{th} distribution and $y = \sum_j y_j$. This mean must be computed by the user.

Standard error of a median. The sampling variability of an estimated median depends upon the form of the distribution as well as the size of its base. An approximate method for measuring the reliability of an estimated median is to determine a confidence interval about it. (See the section on sampling variability for a general discussion of confidence intervals.) The following procedure may be used to estimate the 68-percent confidence limits and hence the standard error of a median based on sample data.

1. Determine, using the standard error tables and factors or formula (4), the standard error of the estimate of 50 percent from the distribution.
2. Add to and subtract from 50 percent the standard error determined in step (1).
3. Using the distribution of the characteristic, calculate the values from the distribution corresponding to the two points established in step (2). These values will be the limits for the 68-percent confidence interval.
4. Divide the difference between the two points determined in step (3) by two to obtain the standard error of the median. For calculations of the confidence interval in step (3), use Pareto interpolation for any point in an income interval greater than \$2,500 in width, and linear interpolation otherwise. A 95-percent confidence interval may be determined by finding the values corresponding to plus and minus twice the standard error determined in step (4).

The formulas used to implement step (3) for Pareto or linear interpolation are:

$$\text{Pareto: } X_{pN} = \exp \left[\frac{\text{Ln}(pN/N_1)}{\text{Ln}(N_2/N_1)} \text{Ln}(A_2/A_1) \right] A_1 \quad (11)$$

$$\text{Linear: } X_{pN} = \frac{pN - N_1}{N_2 - N_1} (A_2 - A_1) + A_1 \quad (12)$$

where N = total number of households or persons in the distribution.

X_{pN} = estimated upper and lower bounds for the confidence interval ($0 < p < 1$). For

purposes of calculating the confidence interval, p takes on the values determined in step (2). Note that X_{pN} estimates the median when $p = 0.50$ is used in the formulas.

A_1 and A_2 = the lower and upper bounds, respectively, on the interval in which X_{pN} falls.

N_1 and N_2 = the estimated number of households or persons with incomes greater than A_1 and A_2 , respectively.

exp is the exponential function.

ln is the natural logarithm function.

It should be noted that a mathematically equivalent result is obtained by using common logarithms (base 10) and antilogarithms.

Since the new, more detailed income intervals used in this report have \$2,500 increments up to \$40,000 for households and families and up to \$20,000 for persons, and since Pareto interpolation will only be used when a median income falls in an interval of width larger than \$2,500 (beginning with March 1980 CPS), this type of interpolation will now be needed very infrequently (i.e., only in cases where the estimated median income exceeds \$40,000 for households and families and \$20,000 for persons). For this reason an illustration of the use of Pareto interpolation in computing a confidence interval for a median has been omitted. An illustration of this procedure can be found in the source and reliability section of Current Population Reports, Series P-60, No. 123.

Use of the above procedure could result in standard errors which differ from those given in the detailed tables. The main reason for this discrepancy is due to use of a more detailed distribution in determining the published standard errors. Linear interpolation was almost always used to compute the published medians and standard errors. Note that when combining distributions the resulting median may lie in an open-ended interval. To calculate its standard error the user must call Population Division of the Census Bureau to obtain the detailed distribution.

Illustration of the computation of a confidence interval and the standard error for a median. Table 6 of this report shows that the median income in 1985 for all family households in the United States is estimated to be \$28,022. Table 6 also shows the base of the distribution from which this median was determined is 63,558,000.

1. Using formula (4), the standard error of 50 percent on a base of 63,558,000 is about 0.3 percentage points.
2. To obtain a 68-percent confidence interval on the estimated median, add to and subtract from 50 percent the standard error found in step (1). This yields percent limits of 49.7 and 50.3.
3. From table 6, 31,171,000 (49.0 percent) family households had income of at least \$27,499, and 34,083,000

(53.6 percent) households had income of at least \$29,999. Therefore, the upper and lower limits on the confidence interval for the median income of family households are to be calculated using linear interpolation. Using formula (12), the lower limit on the estimate is found to be about

$$\frac{(.497)(63,558,000) - 31,171,000}{34,083,000 - 31,171,000} (\$29,999 - \$27,499) + \$27,500 = \$27,858$$

Similarly, the upper limit is found to be about

$$\frac{(.503)(63,558,000) - 31,171,000}{34,083,000 - 31,171,000} (\$29,999 - \$27,500) + \$27,500 = \$28,186$$

Thus, the 68-percent confidence interval on the estimated median of \$28,022 is from \$27,858 to \$28,186.

4. The standard error of the median is, therefore, $(28,186 - 27,858)/2$, or \$164. (Note: Published standard errors are calculated by the same method as above.

However, a different standard error may be obtained because of round-off errors; for example, for the above illustration, table 6 gives a standard error of \$149.)

21. (If in 19, skip to 21A.) Did ... have a job or business from which he/she was temporarily absent or on layoff LAST WEEK?

Yes **1** No **2** (Go to 22)

21A. Why was ... absent from work LAST WEEK?

Own illness ... **1**

On vacation ... **2**

Bad weather ... **3**

Labor dispute ... **4**

New job to begin within 30 days **5** (Skip to 22B and 22C2)

Temporary layoff (Under 30 days) **6**

Indefinite layoff (30 days or more or no def. recall date) **7** (Skip to 22C3)

Other (Specify) ... **8**

21B. Is ... receiving wages or salary from his/her employer for any of the time off LAST WEEK?

Yes **1** No **2**

21C. Does ... usually work 35 hours or more a week at this job?

Yes **1** No **2**

22. (If LK in 19, Skip to 22A.) Has ... been looking for work during the past 4 weeks?

Yes **1** No **2** (Go to 24)

22A. What has ... been doing in the last 4 weeks to find work? (Mark all methods used; do not read list.)

Checked pub. employ. agency **1**

Checked pvt. employ. agency **2**

Employer directly ... **3**

Friends or relatives ... **4**

Placed or answered ads ... **5**

Nothing (Skip to 24) ... **6**

Other (Specify in notes, e.g., JTPA, union or prof. register, etc.) ... **7**

22B. At the time ... started looking for work, was it because he/she lost or quit a job or was there some other reason?

Lost job ... **1**

Quit job ... **2**

Left school ... **3**

Wanted temporary work ... **4**

Change in home or family responsibilities **5**

Left military service ... **6**

Other (Specify in notes) ... **7**

22C. 1) How many weeks has ... been looking for work?

1 **1** 2 **2** 3 **3** 4 **4** 5 **5** 6 **6** 7 **7** 8 **8** 9 **9**

2) How many weeks ago did ... start looking for work?

1 **1** 2 **2** 3 **3** 4 **4** 5 **5** 6 **6** 7 **7** 8 **8** 9 **9**

3) How many weeks ago was ... laid off?

1 **1** 2 **2** 3 **3** 4 **4** 5 **5** 6 **6** 7 **7** 8 **8** 9 **9**

22D. Has ... been looking for full-time or part-time work?

Full **1** Part **2**

22E. Could ... have taken a job LAST WEEK if one had been offered?

Yes **1** No **2** Why not?

Already has a job ... **1**

Temporary illness ... **2**

Going to school ... **3**

Other (Specify in notes) ... **4**

22F. When did ... last work at a full-time job or business lasting 2 consecutive weeks or more?

Within last 12 months (Specify) ... **1**

(Month) _____

One to five years ago ... **2**

More than 5 years ago ... **3**

Never worked full-time 2 wks. or more ... **4**

Never worked at all ... **5**

Never worked at all ... **6**

(SKIP to 23. If layoff entered in 21A, enter job, either full or part time, from which laid off. Else enter last full time job lasting 2 weeks or more, or "never worked.")

23. DESCRIPTION OF JOB OR BUSINESS

23A. For whom did ... work? (Name of company, business, organization or other employer.)

23B. What kind of business or industry is this? (For example: TV and radio mfg., retail shoe store, State Labor Dept., farm.)

23C. What kind of work was ... doing? (For example: electrical engineer, stock clerk, typist, farmer.)

23D. What were ...'s most important activities or duties at this job? (For example: types, keeps account books, files, sells cars, operates printing press, finishes concrete.)

23E. Was this person an employee of a PRIVATE Co., bus., or individual for wages, salary or comm. ... P **1**

A FEDERAL government employee ... F **2** (Go to 23F)

A STATE government employee ... S **3**

A LOCAL government employee ... L **4**

Self-empl. in OWN bus., prof. practice, or farm

Is the business incorporated? Yes **1** No **2** SE **3** (Skip to 26)

Working WITHOUT PAY in fam. bus. or farm. ... WP **4** (Skip to 26)

NEVER WORKED ... NEV **5**

23F. INTERVIEWER CHECK ITEM

Entry for NA in item 20A **1** (Go to 25 at top of page)

Entry for NA in item 21B **2**

All other cases **3** (Skip to 26)

24. INTERVIEWER CHECK ITEM (Rotation number)

First digit of SEGMENT number is: 0 2, 3, 4, 6, 7 or 8 (Skip to 26) 1 or 5 (Go to 24A)

24A. When did ... last work for pay at a regular job or business, either full- or part-time?

Within past 12 months **1**

1 up to 2 years ago ... **2** (Go to 24B)

2 up to 3 years ago ... **3**

3 up to 4 years ago ... **4**

4 up to 5 years ago ... **5**

5 or more years ago ... **6** (Skip to 24C)

Never worked ... **7**

24B. Why did ... leave that job?

Personal, family (incl. pregnancy) or school ... **1**

Health ... **2**

Retirement or old age ... **3**

Seasonal job completed ... **4**

Slack work or business conditions **5**

Temporary nonseasonal job completed ... **6**

Unsatisfactory work arrangements (Hours, pay, etc.) **7**

Other ... **8**

24C. Does ... want a regular job now, either full- or part-time?

Yes ... **1** (Go to 24D)

Maybe - it depends (Specify in notes) **2**

No ... **3** (Skip to 24E)

Don't know ... **4**

24D. What are the reasons ... is not looking for work? (Mark each reason mentioned)

Believes no work available in line of work or area **1**

Couldn't find any work ... **2**

Lacks nec. schooling, training, skills or experience **3**

Employers think too young or too old ... **4**

Other pers. handicap in finding job **5**

Can't arrange child care ... **6**

Family responsibilities ... **7**

In school or other training ... **8**

Ill health, physical disability ... **9**

Other (Specify in notes) ... **0**

Don't know ... **1**

24E. Does ... intend to look for work of any kind in the next 12 months?

Yes ... **1**

It depends (Specify in notes) **2**

No ... **3**

Don't know ... **4**

(If entry in 24B, describe job in 23, otherwise, skip to 26)

25. INTERVIEWER CHECK ITEM (Rotation number)

First digit of SEGMENT number is: 0 2, 3, 4, 6, 7 or 8 (Skip to 26) 1 or 5 (Go to 25A)

25A. How many hours per week does ... USUALLY work at this job?

0 **0** 1 **1** 2 **2** 3 **3** 4 **4** 5 **5** 6 **6** 7 **7** 8 **8** 9 **9**
